

Protect your skin at work

1

The sun and its UV rays damage skin - no matter your skin colour. The damage can turn into skin cancer over time.

2

Two in three Australians will get skin cancer. Working outside puts you in the sun more.

3

UV rays can damage skin even on a cool or cloudy day.

4

The good news is that most skin cancer can be prevented.

5

To stay healthy for you and your family, you should wear:

- a hat
- sunglasses
- sunscreen
- long sleeves

and stay in the shade when you can!

6

See a doctor if you see changes, like a new spot that has changed colour or shape.

7

Watch this short video to learn more to keep yourself healthy and working longer for you and your family.
