Skin Cancer and Outdoor Work

Introduction

Workers who spend all or part of the day working outdoors are at risk of skin cancer. This is because solar radiation is carcinogenic to humans. All skin types can be damaged by exposure to ultraviolet (UV) radiation. Damage is permanent and irreversible and increases with each exposure.

Under Australian Work Health and Safety legislation, employers in NSW are required to provide a safe working environment for all employees. Implementing a comprehensive sun protection program, which includes a range of simple protective measures, can prevent sun-related injuries and reduce the suffering and costs associated with skin cancer – including reduced productivity, morale and financial returns.

Occupations especially at risk due to the outdoor nature of the work include:

- building and construction workers
- telecommunications and utilities workers
- swimming pool and beach lifeguards
- police and traffic officers
- agricultural, farming and horticultural workers
- landscape and gardening workers
- fisheries workers
- road workers
- municipal employees
- postal workers
- dockyard, port and harbour workers
- catering workers
- outdoor events workers
- physical education teachers and outdoor sports coaches
- surveyors
- forestry and logging workers
- ski instructors and lift operators
- mining and earth resources workers
- taxi, bus and truck drivers and delivery and courier services
- labour hire company workers.

Purpose of this resource

This booklet explores the relationship between exposure to UV radiation and skin cancer. It provides you with information and advice to understand and confidently address sun protection in the workplace.

A comprehensive sun protection program is described, including various sun protection control measures presented as per the hierarchy of occupational hazard controls. Tips for success are included, along with a sample policy to assist with the development and implementation of your program.
The case for sun protection at work

Australia has one of the highest levels of skin cancer in the world. Despite being an almost entirely preventable disease, at least two in every three Australians will develop skin cancer before they reach the age of 70.

The amount of exposure required to cause skin cancer varies greatly from one person to another. However, in most people the risk of skin cancer increases with increasing amounts of exposure to the sun.

The workplace is a major source of exposure for many adult Australians with outdoor workers receiving between five and ten times more sun exposure than indoor workers. It is not surprising that outdoor workers who are required to spend long periods of time working in the sun, year after year, have a higher than average risk of skin cancer.
The harmful health effects of ultraviolet (UV) radiation
Exposure to ultraviolet radiation (UV radiation) is known to cause adverse health effects on the skin, eyes and immune system.

Sunburn
Sunburn is a radiation burn to the skin. In Australia, sunburn can occur in as little as 11 minutes on a fine January day. All types of sunburn, whether serious or mild, can cause permanent and irreversible skin damage.

Mild sunburn that reddens and inflames the skin is known as first-degree sunburn. Second-degree sunburn occurs with more serious reddening of the skin and water blisters. Third-degree sunburn requires medical attention.

Solar keratoses and premature ageing of the skin
Solar keratoses are red, flattish, dry, scaling areas on the skin, sometimes called sunspots. Sunspots are a warning sign that a person is prone to skin damage and skin cancer.

Most visible signs of ageing are the result of damage to the skin caused by exposure to UV radiation. This can include skin wrinkling, loss of elasticity, irregular pigmentation and altered skin texture.

Eye damage
Acute effects of exposure to UV radiation on the eye include photokeratitis (inflammation of the cornea and the iris) and photoconjunctivitis (inflammation of the conjunctiva, the membrane that lines the inside of the eyelids and white of the eye), more commonly known as snow blindness or welder’s flash.

Symptoms range from mild irritation to severe pain. There is evidence that chronic exposure to UV radiation contributes to age-related macular degeneration and cataracts, both a cause of blindness. Long-term effects may also include pterygium (white or creamy opaque growth on the cornea), squamous cell carcinoma of the conjunctiva and cancer on the skin surrounding the eye.

Skin cancer: the facts
The most serious health effect of exposure to UV radiation is skin cancer.

Our body is made up of tiny building blocks called cells. Cells normally grow, divide, die and are replaced in a controlled way. Cancer is a disease that occurs when the cells of the body are damaged, causing them to grow out of control.

The skin is the largest organ of the body. Skin cancer can grow when the cells that make up our skin are damaged. In most cases this damage is caused by overexposure to UV radiation.

The top layer of the skin contains three different types of cells: basal cells, squamous cells and melanocytes. Skin cancer types are named after the type of skin cell in which the cancer develops.

The three types of skin cancer are:
1. Basal cell carcinoma (BCC) is the most common type of skin cancer. It grows slowly over months and years and may damage nearby tissues and organs if left untreated.
2. Squamous cell carcinoma (SCC) is less common but grows faster. It may spread to other parts of the body if left untreated.
3. Melanoma is the least common but most dangerous type of skin cancer. Most skin cancer deaths are from melanoma. It is often fast growing and can spread to other parts of the body where it can form a new cancer.

Basal cell carcinomas and squamous cell carcinomas are often grouped together and called non-melanoma or common skin cancers.

Did you know?
A range of information on working safely in the sun, and support for workplaces and managers, is available from Cancer Council NSW. Workplaces can also access the free SunSmart UV Alert widget and add it to their website homepage. The widget shows the daily weather, temperature and UV level specific to the site’s location including details about the times sun protection is required each day.

View today’s SunSmart UV Alert for your local area. Download the SunSmart UV Alert widget.
Skin cancer: an occupational disease priority area

Skin cancer can be an employment-related disease resulting from repeated and long-term exposure to a known carcinogen. Skin cancer therefore fits within the national health and safety priority action area of preventing occupational disease more effectively.

The 2011 report on Workers’ compensation claims paid in Australia 2000-2009, Occupational exposure to ultraviolet (UV) radiation by Cancer Council Western Australia showed Safe Work Australia data indicating that a total of 1360 workers’ compensation claims for sun related injury/disease were made between 2000 and 2009, at a total cost of $38.4 million\textsuperscript{12}.

It is suggested that given the long latency period associated with exposure and the onset of skin cancer, it is also likely that compensation claims greatly understate the real incidence of occupational skin cancer\textsuperscript{13}.

Legal obligations

Work health and safety legislation, specific to each Australian state or territory, has the clear objective of preventing illness and injury at work and saving lives.

All employers must protect workers by providing a safe working environment that is free of health risks. This includes taking proper steps to reduce the known health risks associated with exposure to UV radiation for workers who spend all or part of their time working outdoors.

Workers also have a duty to take care of their own health and safety and cooperate with employers’ efforts to improve health and safety.

Did you know?

Sun exposure is the cause of about 99% of non-melanoma skin cancers and 95% of melanoma in Australia\textsuperscript{14}. A very small number of skin cancers are due to genetic predisposition. Both melanoma and non-melanoma skin cancers can appear anywhere on the body, not just sun areas exposed to the sun.

Number of claims for sun related injury/disease (including cancers) in Australia by year of lodgement, 2000-2009

Data sourced from SafeWork Australia
To work safely in the sun, workers must follow workplace sun protection policies and procedures, attend training follow instructions and advice provided, and use supplied protective equipment as instructed.

Other key documents providing technical advice and guidelines on sun protection for outdoor workers include:

- **Guidance note for the protection of workers from ultraviolet radiation in sunlight** – Australian Safety and Compensation Council (ASCC). Visit safeworkaustralia.gov.au to view or obtain a copy.

Contact WorkCover NSW for more information on workplace health and safety workcover.nsw.gov.au

### NSW Workers Compensation Commission

#### Case No. 8 v Company [2009] NSW WCC 5671

Case No. 8 worked outdoors as a road construction foreman and concrete finisher for a local government. He did not wear protective clothing or apply sunscreen during his 13 years of employment prior to 1989, after which his employer provided him with protective clothing and sunscreen. He suffered basal cell carcinomas on his head/face, chest, neck, back, legs and arms, which had to be removed at considerable cost.

The NSW Workers’ Compensation Commission accepted Case No. 8’s claim and ordered Company 8 to pay $25,930.85 for his medical treatment, related expenses, and legal costs.

#### Case No. 9 v Company 9 [2009] NSW WCC 5997

Case No. 9 claimed compensation for injuries caused by working outdoors for his former employer, an energy company, between 1974 and 1995. He suffered facial disfigurement, severe bodily disfigurement and loss of sexual capacity caused by skin cancer.

The Commission heard evidence that between 1999 and the time his case was heard Case No. 9 visited doctors over 120 times to have skin cancers treated. On virtually all of these occasions he was incapacitated for anywhere from two weeks to two months afterwards, as the majority of the skin cancer wounds became infected. The Commission accepted that his condition meant he could no longer spend any significant time outdoors, which affected his ability to enjoy the amenities of life. Case No. 9 also submitted that his unsightly appearance and bodily disfigurement caused the loss of his sexual relationship with his wife.

The Commission awarded Case No. 9 $20,000 for pain and suffering, $6,400 for his facial disfigurement, $7,500 for his bodily disfigurement, and $9,400 for his loss of sexual function. Company 9 was also ordered to pay legal costs.

**Facts about UV Radiation**

Understanding UV radiation is vital for understanding the sun protection control measures recommended.

UV radiation is part of the electromagnetic spectrum emitted by the sun. It can be divided into three types: UVA, UVB and UVC. While all UVC and most UVB radiation is absorbed by the atmosphere, all UVA and about 10% of UVB radiation does reach the earth’s surface. Both UVA and UVB are known causes of skin cancer.

Did you know UV radiation from the sun:
- is high-energy radiation, capable of causing damage to living organisms
- is carcinogenic to humans
- cannot be seen or felt
- is not related to temperature
- can be high even on cool and cloudy days
- can pass through clouds
- can pass through loosely woven material
- can bounce off reflective surfaces such as metal, concrete, water and snow
- is the best natural source of vitamin D and is essential to health in small amounts.

**Direct and indirect sources of UV radiation**

Factors affecting levels of UV Radiation

UV radiation can reach you on the ground directly from the sun. It can also be scattered by particles in the air and reflected by ground surfaces such as metal, concrete, sand and snow.

The total amount of UV radiation present in a given location is affected by the following:

- **Sun elevation**: The higher the sun in the sky, the higher the levels of UV radiation at the earth’s surface. Therefore levels of UV radiation are highest in the middle of the day and during summer.
- **Latitude**: The closer to equatorial regions, the higher the levels of UV radiation.
- **Cloud cover**: UV radiation can pass through light cloud cover, and on lightly overcast days the intensity of UV radiation can be similar to that of a cloud-free day. Heavy cloud can reduce the intensity of UV radiation. Scattered cloud has a variable effect on levels of UV radiation, which rise and fall as clouds pass in front of the sun.
- **Altitude**: At higher altitudes, the atmosphere is thinner and absorbs less UV radiation.
- **Ozone**: Ozone absorbs some of the UV radiation that would otherwise reach the earth’s surface.
- **Reflective surfaces**: Some building and ground surfaces such as polished aluminium, construction materials, lightly coloured concrete and water can reflect UV radiation back onto the skin and eyes.

When developing your sun protection program it is important to remember that your workers will need protection from exposure to both direct and indirect sources of UV radiation.

(Source: World Health Organization 2002)
Describing levels of UV Radiation

UV levels vary across NSW on any given day. The UV Index is a tool that can be used to show the intensity of the sun’s UV radiation. It divides UV radiation into levels:

- **low** (1-2)
- **moderate** (3-5)
- **high** (6-7)
- **very high** (8-10)
- **extreme** (11 and above).

The higher the number, the stronger UV levels are and the less time it will take for skin damage to occur. When UV levels are 3 and above, UV rays are strong enough to damage the skin and Cancer Council NSW recommends using sun protection.

When the UV Index is at 3 and above, sun protection is required, as the amount of UV radiation reaching the earth's surface is strong enough to damage the skin, which can lead to skin cancer. When the UV level is below 3 it is safe to get some sun without protection to help with vitamin D.

However, it is recommended that for outdoor workers who spend extended periods of time outdoors, for those who work in alpine regions, or highly reflective surfaces, sun protection should be used when the UV is below 3.

For best protection, a combination of sun protection measures is needed:

- Slip on some sun-protective work clothing
- Slap on a broad brimmed hat
- Slop on at least SPF 30+ sunscreen
- Slide on some sunglasses
- Seek shade
The SunSmart UV Alert

The SunSmart UV Alert is a tool workplaces can use to help workers be more sunsmart.

Based on the UV Index, the Bureau of Meteorology issues the SunSmart UV Alert whenever the UV Index is forecast to reach 3 or above.

Daily sun protection times can also be accessed from the free SunSmart app for smart phones. SunSmart has also developed the SunSmart UV Alert widget that can be added to your workplace intranet pages by visiting cancercouncil.org.au/sunsmart

The SunSmart UV Alert is reported daily in some television, radio weather forecasts and newspapers around Australia.

Live UV levels are available for Australian capital cities via the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) website at arpansa.gov.au

Photosensitivity

Photosensitivity is an abnormally high sensitivity of the skin or eyes to UV radiation. This can cause the skin to burn more easily and increase your risk of skin cancer.

Photosensitivity is caused by ingestion, inhalation or skin contact with substances known as photosensitisers. Some substances that cause photosensitivity include industrial chemicals, drugs, plants and some essential oils and fragrances.

A risk assessment used to identify work situations where workers are exposed to the sun should also identify any photosensitising substances which may be associated with the work people do.

Some medications can cause photosensitivity. Check with your doctor or pharmacist, as alternative medication may be available.

Cancer Council NSW recommends the use of sun protection measures when UV levels are 3 and above and at all times of the year when working outdoors.
UV radiation and glass

There are many different types of glass. Each provides very different levels of sun protection.

House window glass
House window glass has an ultraviolet protection factor (UPF) of 10. This means one tenth (10%) of UV radiation will pass through. The window absorbs the remaining 90%. This type of glass provides only moderate protection against UV radiation.

Office building glass
Office building glass has a UPF of 50+, which means one fiftieth (less than 1%) of UV radiation will pass through. The window absorbs the remaining 99%. This type of glass provides excellent protection.

Vehicle glass
The levels of UV radiation inside a car vary, depending on whether the side windows are open or closed and the orientation of the vehicle with respect to the sun.

Laminated windscreens, which are made of a tough plastic layer bonded between two panes of glass, have UPF ratings of 50+. However the plain window glass used in car side windows is usually about a UPF 12, which provides only moderate protection unless clear or tinted film is applied.

A person sitting in a car can still receive significant exposure to UV radiation. Cancer Council NSW recommends that people who spend long periods of time in a car when UV levels are 3 and above use sun protection. This will ensure occupants are protected both in the vehicle and when they leave it.

Refer to the Cancer Council Australia position statement on tinting of car and window glass. Go to cancer.org.au/sunsmart
UV radiation and heat

In addition to UV radiation, the sun emits other radiation including visible light and infrared radiation. We can see visible light and we feel infrared radiation as heat.

Heat or high temperatures are not related to levels of UV radiation. Temperature relates to the amount of infrared radiation present in sunlight, not UV radiation, so it is incorrect to use temperature as a guide to determine when sun protection is needed.

Heat illness

When the body is unable to cope with working in heat, heat illness can occur. Heat illness covers a range of medical conditions including heat stroke, heat exhaustion, heat cramps and skin rashes. Signs and symptoms of heat illness include nausea, dizziness, clumsiness, collapse and convulsions. If left untreated, heat illness can be fatal.

Did you know?

It is a common misconception that you can ‘feel yourself getting sunburnt’. UV radiation cannot be seen or felt so it can damage our skin without us knowing.

Exposure to UV radiation and heat illness are separate occupational hazards for outdoor workers. However, the effect of heat must be considered when implementing a sun protection program for the following reasons:

- Working in hot conditions may contribute to non-compliance with sun protection measures. The use of personal protective equipment and clothing may decline due to heat discomfort.
- Inappropriately designed and heavy covering clothing worn for sun protection can contribute to a worker’s risk of heat illness. Select material and a design that provides sun protection while keeping workers cool in hot conditions.
- In some cases, control measures can reduce workers’ risk of both heat illness and exposure to UV radiation. These include:
  - Provision of shade for outdoor work.
  - Rest breaks in cooler, shaded or indoor areas. Additional breaks may be needed.
  - Provision of loose fitting, lightweight clothing for air movement and sun protection.
  - Changes to work schedules that allow heavy work to occur during cooler times of the day. This may also coincide with the times when UV radiation is less intense, such as early in the morning or late in the afternoon.
  - The use of more people and rotation of workers between cooler, shaded tasks and hot outdoor work.

Contact WorkCover NSW for more information on heat illness and heat discomfort workcover.nsw.gov.au
Making a case for sun protection: tips for success

- Form a small working party. Seek representatives from across the organisation to investigate, plan, develop and guide implementation of your sun protection program. Health and safety representatives, where in place, should be involved in the working party.
- Research widely to gather information. Collect data and information on numbers of workers at risk, compensation claims for sun-related injuries, incidence of sunburn, and what similar organisations and industries are doing. Clarify your duty of care and legal obligations.
- Consult with workers and their representatives. Ask their opinions and needs, by conducting surveys and interviews of workers to learn more about attitudes, awareness of the issue and current behaviour in regard to sun protection.
- Design your sun protection program. Use the recommendations in this booklet to design the program and write your policy. Circulate the draft to seek feedback and approval.
- Establish a budget to develop and implement the program.
- Officially launch the program so all workers are aware of its existence. Use newsletters and websites to publicise the program as widely as possible.
- Document the process. Keep a written record of what has been undertaken and the results of all actions. This will provide valuable information to review the program and policy later, and identify possible reasons for success or failure.

Protecting your workers

When it comes to health in the workplace, prevention is far better than cure. In consultation with health and safety representatives and workers, employers should identify UV radiation exposure hazards, and introduce control measures to reduce exposure.

Cancer Council NSW recommends that workplaces have a comprehensive sun protection program in place that includes:

- Risk assessment: periodic assessment of the UV radiation exposure risk to all workers.
- Sun protection control measures: the introduction and maintenance of protective measures in line with occupational hazard controls.
- Training workers to work safely in the sun: the provision of information, instruction, training and supervision for workers.
- Sun protection policy: documentation of the program, including control measures, in a written policy.
- Monitoring program effectiveness: a process to determine the effectiveness of control measures and identify changes that may further reduce exposure.
Risk assessment

Risk assessment is a step in the hazard management process used to identify:

- workers who have a high risk of exposure to UV radiation
- situations or work systems where high exposure to UV radiation occurs.

Total exposure to UV radiation during outdoor jobs depends on factors such as:

- the geographical location of the job
- the time of year when outdoor work occurs
- the times of the day when outdoor work occurs
- the pattern and length of exposure – exposure can occur in an ongoing episode or via a series of shorter episodes which add up over the day
- the availability and use of control measures
- the presence of reflective surfaces
- the presence of photosensitisers.

Sun protection measures

Once the risk has been assessed, employers and workers should work together to make changes to minimise the risk.

A comprehensive sun protection program should include the introduction of protective measures in line with occupational hazard controls including:

- engineering controls, which are measures that reduce exposure to UV radiation by a physical change to the work environment
- administrative controls, which are measures that reduce exposure to UV radiation by a change in work procedure and the way work is organised
- personal protective equipment and clothing, which are measures that reduce exposure to UV radiation by providing a personal barrier between individual workers and the hazard.

Safe Work Australia Code of Practice - “Managing the Work Environment and Facilities Code of Practice” refers to UV radiation and outdoor work. Visit safeworkaustralia.gov.au

Engineering controls

Providing shade, modifying reflective surfaces and using window tinting on vehicles are all examples of engineering controls that reduce workplace exposure to direct and indirect sources of UV radiation.

Provide shade

Shade is one of the most effective forms of sun protection for outdoor workers. Shade can come naturally from trees and shrubs, or artificially from permanent or portable structures, which can be easily erected and adapted to suit different types of equipment and worksites.

Although some forms of shade can initially be expensive, the cost and health benefits are long term. Even if it is difficult for work to occur in the shade, provision should be made for shade during breaks, especially lunch breaks.

When considering shade options to protect workers from UV radiation keep in mind that:

- Shade needs to be effective. To evaluate the effectiveness of shade consider both the protection from UV radiation provided by the vegetation and/or material as well as the coverage the shade provides.
- The quality of shade from natural sources such as vegetation depends on the density of the foliage, the size of the canopy, the shape of the vegetation and how far the canopy is from the ground.
- If you are using materials such as canvas, knitted polyethylene or woven PVC shadecloth keep in mind that different fabrics have different UV radiation absorbing properties:
  - less UV radiation passes through tightly woven fabrics
  - darker colours usually block more UV radiation than light colours
  - heavier-weight fabrics usually block more UV radiation than light-weight fabrics of the same type
  - fabrics that are overstretched, wet or worn out may have reduced UV radiation protection.
- In general the larger the structure, the more protection provided.
- Position under the shade is important. Levels of UV radiation are greater near the edge of shaded areas than at the centre.
- UPF ratings for shade apply to material only. The overall protection provided also depends on the design of the structure itself, its placement relative to the sun and how it is used.
- Portable shade offers limited protection. It can provide a quick and cheap solution to shade small numbers of people, and is ideal for places where no other shade options are available. Position to allow occupants to work away from sides and openings.
- Existing shade at the worksite, such as buildings, trees and other structures, may provide shade for workers. Look to relocate jobs to take advantage of existing shade if possible.
- You can never rely on shade alone. A worker working in the shade may still receive a substantial amount of exposure from indirect sources of UV radiation such as reflection from a nearby surface. Always combine shade with personal sun protection measures.

**Modify reflective surfaces**

Some ground and building surfaces reflect UV radiation.

<table>
<thead>
<tr>
<th>Material</th>
<th>Level of reflected UV radiation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lawn grass, summer/winter</td>
<td>2.0% – 5.0%</td>
</tr>
<tr>
<td>Grasslands</td>
<td>0.8% – 1.6%</td>
</tr>
<tr>
<td>Soil, clay/humus</td>
<td>4.0% – 6.0%</td>
</tr>
<tr>
<td>Asphalt roadway, new (black), old (grey)</td>
<td>4.1% – 8.9%</td>
</tr>
<tr>
<td>House paint, white</td>
<td>22.0%</td>
</tr>
<tr>
<td>Boat deck, wood/fibreglass</td>
<td>6.6% – 9.1%</td>
</tr>
<tr>
<td>Open water</td>
<td>3.3%</td>
</tr>
<tr>
<td>Open ocean</td>
<td>8.0%</td>
</tr>
<tr>
<td>Sea surf, white foam</td>
<td>25.0% – 30.0%</td>
</tr>
<tr>
<td>Beach sand, wet</td>
<td>7.1%</td>
</tr>
<tr>
<td>Beach sand, dry, light</td>
<td>15.0% – 18.0%</td>
</tr>
<tr>
<td>Snow, old/new</td>
<td>50.0% – 88.0%</td>
</tr>
<tr>
<td>Concrete footpath</td>
<td>8.2% – 12.0%</td>
</tr>
</tbody>
</table>

When considering changes to reduce exposure to indirect UV radiation from reflective sources, keep in mind:
- Surface type: soft and rough surfaces reflect less UV radiation than hard and/or smooth surfaces.
- Colour: simply painting a surface a less reflective colour can reduce indirect exposure.

**Consider window tinting**

Clear or tinted films applied to building windows or to the side windows of a vehicle can substantially reduce the amount of UV radiation transmitted into a vehicle. The amount of protection varies with different products, so check with the product supplier.

Applying films and tints will only be effective if the windows are closed, so air conditioning of vehicles may also be required.

Businesses must weigh up the costs against the benefits.

Refer to the Cancer Council Australia position statement on tinting of car and window glass. Go to cancer.org.au/sunsmart

Administrative controls

An effective way to protect workers is to encourage them to minimise the amount of time spent working in the sun, particularly when levels of UV radiation are strongest.

Reschedule outdoor work programs

When considering changes to outdoor work schedules to minimise exposure:

- Plan work routines so outdoor work tasks are done early in the morning or later in the afternoon when levels of UV radiation are lower.
- Plan work routines so indoor or shaded work tasks are done during the middle of the day when levels of UV radiation are strongest.
- Move the job indoors or into shaded areas.
- Share outdoor tasks and rotate staff so the same person is not always out in the sun.

Use the SunSmart UV Alert

Introduce a new system that encourages workers to look at the SunSmart UV Alert every day. The UV Alert tells workers the daily sun protection times so they know when to use sun protection measures.

- Establish a system for all workers to receive a daily text message reminder of the UV Alert.
- Ensure newspapers are available to workers and encourage them to check the UV Alert on a daily basis. Leave them open at the weather page.
- Set up a SunSmart UV Alert sign at key worksite entrance and exit points and on bulletin boards in the staff lunch room. Change the sign on a daily basis to reflect the Alert forecast for the coming day.
- Upload the SunSmart UV Alert widget to your intranet pages.
- Remind workers to check the sun protection times daily.
- Encourage workers to download the free SunSmart smart phone app and to check daily sun protection times.
- Plan work schedules based on the UV Alert.
- Make SunSmart UV Alert announcements during the day.
- Ensure workers are trained in ‘how to read’ the SunSmart UV Alert.

The SunSmart UV Alert is reported for over 200 locations across Australia, so check and use the UV Alert for the location closest to your worksite.
Personal protective equipment and clothing

The use of personal protective equipment and clothing (PPE) in regards to sun protection includes:

• provision of sun protective work clothing
• provision and use of sun protective hats
• provision and use of sunglasses
• provision and use of sunscreen.

Choose carefully when using PPE as the control option, keeping in mind the type of outdoor work being performed. The design must balance sun protection with the need to stay cool in hot conditions.

Workers must be trained in the correct use of all PPE. It is important that design and/or usage do not create a secondary hazard such as loose clothing becoming caught in machinery.

Sun protective work clothing

One of the most effective barriers between skin and the sun is clothing. The overall protection provided by clothing depends both on the material from which it is made and the garment’s design.

When selecting sun protective clothing for outdoor workers keep in mind that:

• Different types of fabric provide different protection. Closeness of weave, colour and condition can affect the ability of material to absorb UV radiation.
• Fabrics may carry a swing tag with a UPF rating. These fabrics have been tested to determine how effective they are at blocking UV radiation. The higher the UPF rating, the more protection provided. UPF 50+ provides the best protection.
• Fabrics that do not carry a UPF rating do not necessarily offer less protection, it just means they haven’t been tested for sun protection.
• The design should cover as much skin as possible. Long pants and shirts with a collar and long sleeves provide the best sun protection.
• Keeping cool is also important. Specially designed work clothing is now available that is lightweight and cool, yet still provides maximum sun protection. In the heat it is important that garments draw perspiration away from the body to help the body stay cool.

Sun protective hats

A sun protective hat is one that shades the face, head, ears and neck. As with clothing, the overall protection provided depends on the material from which the hat is made together with the design.

When selecting sun protective hats for your outdoor workers keep in mind that:

• You will need to check the UPF rating of the fabric. If you can see through the hat material, the sun will get through, which is why a close weave is important. As with clothing, hats will carry a swing tag if the material has been tested to determine how effectively it blocks UV radiation.
• A broad brimmed, bucket or legionnaire style hat provides best protection.
• A broad brimmed and bucket hats provide the most sun protection for the face and head. Legionnaire hats provide satisfactory sun protection and are more suitable when work involves a lot of bending.
• Baseball caps do not provide protection from UV radiation. Baseball caps are not recommended as they fail to shade most of the face, neck or ears.
• Broad brimmed hats should have a brim of at least 7.5cm. A broad brimmed hat alone can reduce sun exposure to the eyes by 50%. When teamed with sunglasses and sunscreen, protection provided substantially increases.
• Bucket hats should have a deep crown, sit low on the head and have an angled brim of at least 6cm.
• Legionnaire style hats should have a flap that covers the neck. The side of the flap should meet with the peak to provide protection to the side of the face.
• Attachable brims and neck flaps are available for hard hats or helmets.
• Hats should always be used in combination with other forms of sun protection.

Sunglasses

Sunglasses can provide excellent protection for the eyes. The overall protection provided depends on the protective qualities of the lens together with the design of the sunglasses.

When selecting sunglasses for your workers, keep in mind that:

- All sunglasses sold in Australia must comply with the sunglass standard AS/NZS 1067:2003: Sunglasses and Fashion Spectacles.
- The sunglass standard defines five categories of lenses and all sunglasses sold in Australia must be labelled to indicate which category they comply with. Look for the words ‘good UV protection’ on the label or swing tag and be aware that category 0 and 1 are fashion spectacles – not sunglasses.
- Due to colour or darkness of the lens some sunglasses must not be used when driving. If your workers are required to operate vehicles, read the label description carefully to ensure sunglasses are suitable for driving.
- Some sunglasses may be labelled with an eye protection factor or EPF. This is a scale from one to 10 which is used to classify how well a lens blocks UV radiation. If a lens has been tested it may state an EPF rating on the label. Sunglasses with an EPF of 9 and 10 transmit almost no UV radiation.
- Close-fitting, wrap around style sunglasses are best. This design stops UV radiation from entering the sides and top of the lenses.
- Polarised lenses reduce glare, which is reflected visible light. This makes it easier to see on a sunny day.
- Some workers may need additional eye protection from flying objects or glare. In this case, choose specialist safety sunglasses that meet the standard for safety glasses AS/NZS 1337.1:2010: Eye and face protectors for occupational applications. Safety glasses still provide good UV protection but will require tinting for use outdoors.
- Prescription glasses, either clear or tinted, are excluded from AS/NZS 1067 but may still provide protection against UV radiation. Workers with prescription glasses or prescription sunglasses should check with their optometrist. Fit-overs are recommended for eyeglasses as few are close fitting and wrap around in style.

Sunscreen

Sunscreen should always be used with other sun protection measures. It is important to realise that no sunscreen offers 100% protection from UV radiation.

When providing sunscreens as PPE keep in mind that:

- All sunscreen must carry a sun protection factor (SPF) rating. Cancer Council NSW recommends the use of at least SPF30+, broad-spectrum and water resistant sunscreen. Broad-spectrum sunscreen filters both UVA and UVB radiation.

Did you know?

The darkness of the lens should not be used to gauge protection from UV radiation. Some clear lenses may provide maximum protection from UV radiation, although a tint is desirable to reduce glare.

Did you know?

The price of sunglasses does not have any relationship to protection from UV radiation. Low cost sunglasses that comply with the sunglass standard may also provide excellent protection from UV radiation.

Did you know?

The Australian Taxation Office has recognised the importance of sun protection for outdoor workers, with tax deductions available for sunscreen, hats and sunglasses.

Visit ato.gov.au for further information.

EPF rating symbol used to classify how well a lens blocks UV radiation

Symbol required when sunglasses must not be used when driving.
• Workers must be educated on the correct way to apply and use sunscreen:
  - Sunscreen should be applied 20 minutes before going outdoors so that it can be absorbed into the skin properly.
  - Regardless of the instructions on the bottle, sunscreen should be reapplied every two hours, or more often if perspiring.
  - Apply sunscreen to clean, dry skin.
  - Use a generous amount of sunscreen. The average-sized adult should apply at least one teaspoon of sunscreen to each arm, leg, front of body and back of body and at least half a teaspoon to the face (including the ears and neck). That is, 35ml of sunscreen for one full body application.
  - Any moisturiser or make up should be applied on top of sunscreen.
• Price is not always an indication of quality. Any broad-spectrum sunscreen with a rating of at least SPF 30+ will, if applied correctly, provide good sun protection.
• Sunscreen should be kept in easily accessible places, such as tearooms and site offices, and stocks replaced regularly to avoid deterioration.
• Sunscreen can go off, so always check the expiry date and store in a cool place below 30°C.
• Sunscreen can be bought as a cream, lotion, milk or gel. All sunscreens labelled at least SPF 30+, broad-spectrum work equally well.
• Lips also need to be protected with a lip balm containing at least SPF 30+.

Cancer Council Australia recommends five simple steps to protect workers from sun damage:
1. Slip on sun protective work clothing
2. Slop on at least SPF 30+ sunscreen
3. Slap on a sunsafe hat
4. Reduce exposure to solar UV radiation
5. Slide on some sunglasses

Control measures: tips for success
• Involve workers in designing and/or selecting suitable sun protective clothing and hats, sunglasses and sunscreen. Ask workers which styles and types they prefer.
• Select a manufacturer or supplier who is able to respond to the needs of your industry/workers and design/develop new sun protective products.
• Trial new initiatives. Have outdoor workers trial samples of sun protection clothing and equipment and ask for their views. Some workplaces have a timeline to phase in new uniforms.
• Document feedback. It is particularly important that any feedback, including complaints about changes to clothing or work practices, is documented as soon as it is received.
• Set an example. Ensure managers and supervisors model the use of all sun protective behaviour and practices.
• Train workers in the use of sun protective PPE. There are many misconceptions about the use of sun protection that can be dispelled when workers are informed.
• Sun protection in the workplace is more than Slip! Slop! Slap! Ensure your workers are aware of all the sun protection control measures and the importance of using each in combination, wherever possible.

Cancer Council sunscreen can be purchased online.
Training employees to work safely in the sun

Raising awareness and providing education and training to safety officers, health and safety representatives, supervisors, outdoor workers and new staff is essential to the success of a workplace sun protection program.

A workplace training program can:
- raise the profile of sun protection as a health and safety issue
- improve knowledge and understanding of sun protection measures
- dispel common misconceptions about UV radiation and various sun protection measures
- provide new staff with information on sun protective measures in place within your organisation
- provide information about the early signs of skin cancer
- provide safety personnel and site supervisors with knowledge to confidently address issues that may arise
- improve sun protection behaviour of workers both ‘on’ and ‘off’ the job
- raise workers’ awareness about your workplace sun protection program and policy
- demonstrate the commitment of management to providing a safe working environment
- provide a forum for feedback from workers.

Topics should include:
- harmful health effects of exposure to UV radiation
- risk factors for skin cancer
- factors affecting levels of UV radiation
- correct application and use of sun protection measures
- how to check for skin cancer
- what to look for when checking for skin cancer
- what to do if concerned about a suspicious spot.

Education and training: tips for success

- Target groups for training include management, health and safety personnel, worksite supervisors, at risk workers and new workers.

- Tailor your training program to meet the ongoing needs of the workplace and workers. Use worker surveys, audit results and checklists to identify needs.

- Use a variety of training methods and tools including: tool box talks, guest speakers, introductory or refresher sessions, newsletter articles, poster displays, dissemination of educational brochures and flyers, health and safety noticeboard, reminders via staff meetings and SMS messages, signage and pay slip notes.

- Be creative: use incentive programs, role modelling, family events and competitions to raise awareness about the issue. Try a SunSmart worker of the month or SunSmart team of the week award. Remember, colleagues with a personal experience to share can be powerful advocates for sun protection.
A workplace
sun protection policy

A sun protection policy is a written document that records why and how the UV radiation risk is to be managed by your workplace.

A sun protection policy should include the following key elements:

- description of the hazard and key reasons for the policy
- details of sun protection control measures to action
- details of education and training requirements
- an outline of who is responsible for implementation and monitoring
- procedures for managing non-compliance
- details of review processes.

(Refer to page 28 for a sample sun protection policy.)

Monitoring program effectiveness

When sun protection control measures have been implemented they must be monitored and reviewed on a regular basis, or at least every two years. Employers must also provide supervision to ensure correct use and compliance with control measures.

Where possible, incorporate monitoring of sun protection control measures into existing audit tools used in the workplace, including WHS inspections, on-site supervisor reports and checklists.

Where monitoring reveals non-compliance, it should be managed, as any other non-compliance issue would be, by using the organisation’s standard disciplinary procedures.

Reviewing your sun protection program

It is important to show that your overall sun protection program is successfully implemented. To review the program:

- Ask staff for comments, concerns or difficulties experienced with the new policy and/or control measures.
- Repeat the risk assessment to provide information on changes in UV radiation risk levels and success of sun protection control measures.
- Examine results of monitoring processes to identify behaviour changes in regards to sun protection and the extent of compliance with control measures.
- Repeat worker surveys to identify changes in attitudes and awareness of the issue.
Skin Cancer and Outdoor Work

Developing a policy: tips for success

- Decide if your organisation needs a new policy or if an existing WHS policy can be modified to incorporate sun protection.
- Circulate drafts of the policy for comment.
- Include procedures for dealing with non-compliance and complaints. Non-compliance with the sun protection policy should be managed, as any other non-compliance issue would be. Use the organisation’s standard disciplinary procedures.
- Ensure management is well informed and confident to deal with questions about the policy and non-compliance.
- Set realistic timeframes for the implementation of the policy and its ongoing review. Some workplaces designate a period for adjustment before making sun protection equipment compulsory.
- Regularly reassess the risk and review the policy to ensure it remains current.

Monitoring and review: tips for success

- Monitor the program and the use of control measures closely in the first 12 months.
- Establish a system for collecting regular and ongoing feedback from workers. Try surveys, focus group interviews and worker quizzes.
- Ensure feedback is documented and considered when making changes.
- Consult with workers and their representatives prior to making changes.
- Once established, review the program and policy on a regular basis, or at least every two years.
- Use information gathered during monitoring processes to inform training needs.
Health surveillance and skin cancer

Skin cancer may appear as either a new skin growth or one that has changed in colour, size, shape or texture. Skin cancer can usually be cured if treated early.

It is important to note that there is no screening program in Australia for either melanoma or non-melanoma skin cancer, as they do not meet the recognised criteria for cancer screening.

Cancer Council Australia and the Australasian College of Dermatologists do however recommend the involvement of general practitioners to monitor and assess patients identified as high risk, or patients with concerns about skin cancer.

The early diagnosis and treatment of skin cancer relies heavily on early detection, with an emphasis on self-examination.

Recommendations for workplaces

Work, health and safety legislation requires employers to provide a safe and healthy workplace, have systems of work that are without risks to health and to provide workers with information, instruction and training about hazards and risks. It also requires workers to monitor the health of workers.

In regards to health monitoring of skin cancer, this entails employers giving workers specific information about the risk.

Employers whose workers are exposed to UV radiation may provide regular skin checks for these workers. However skin cancer can develop rapidly. As part of their obligations on this risk to health, employers should provide workers with information on how they can check their own skin for any suspicious spots.

Workers should be informed about:

- the need to check their own skin
- the importance of becoming familiar with how their skin normally looks
- how often they should examine their skin
- tips on how to examine their skin
- what to look for when examining their skin
- what to do if a suspicious spot is noticed.
Skin Cancer and Outdoor Work

Key early detection messages for employees

Outdoor workers should regularly look at their skin for suspicious spots. A good way to remember is to check your skin with each change of season. It is important that workers know what their skin looks like normally so changes will be noticed.

Tips on how to check your skin:
- Check your whole body including the soles of your feet, between your toes, your armpits, ears, eyelids, under your fingernails and scalp.
- Use a hand held mirror or have someone help you to check areas you cannot see such as your back, back of your neck and legs.
- Look for a new spot or a spot that is different from the ones around it.
- Look for a sore that doesn’t heal.
- Look for a spot or mole that has changed in size, shape or colour.

Outdoor workers should be advised to discuss their personal risk factors for skin cancer with their GP. Workers should also be advised to see their GP as soon as possible if they notice anything unusual or have concerns about their skin.

Workplace medical checks and skin cancer

Cancer Council NSW recommends workplaces focus their health surveillance activities on encouraging workers to examine their own skin and providing information to promote the key early detection messages outlined above. However, some workplaces want to provide skin cancer checks within their regular medical examination activities.

The decision to provide a skin cancer check service for outdoor workers should be carefully considered for reasons such as:
- Skin cancer can grow quickly. There is a danger workers will come to rely on skin cancer checks provided by their workplace and therefore fail to notice a skin cancer that appears in the interim.
- A focus on skin cancer checks may result in workers becoming complacent about the use of sun protection control measures to prevent skin cancer.
- The experience and expertise and therefore the quality of service providers vary.
- Your legal obligations may not be met unless there is a clear emphasis on workers knowing how to regularly examine their own skin.
- If skin cancer checks are conducted on a voluntary basis, early detection messages, if delivered, will not reach workers who choose not to attend.
Cancer Council NSW does not operate, recommend or endorse any skin check services or clinics. If your organisation decides to provide a skin cancer check for workers, it is important to ensure the medical practitioner conducting the checks has expertise and training in the area of skin cancer.

The medical practitioner or skin check service provider should:

- Identify workers at high risk such as those with a family history of skin cancer, workers with fair skin that burns rather than tans, workers who are aged 50 or over, workers who have solar keratoses.
- Always promote the complete early detection message.
- Always encourage workers to ‘get to know their own skin’ so changes will be noticed.
- Stress the importance of workers checking their skin regularly throughout the year and not relying on workplace medical checks to detect skin cancer.
- Provide information on how to check for skin cancer.
- Undertake a full body examination for skin cancer.
- Keep a record of the skin examination including a body map documenting suspicious spots.
- Refer the worker to their own doctor or a skin specialist if skin cancer is suspected, for confirmation of diagnosis and further action.
- Stress to the worker the importance of getting further diagnosis and treatment without delay.
- Consider a process to ensure workers follow up with referrals and receive diagnosis and treatment.
- Remind your worker that prevention is better than cure.

Remember: All workers should be encouraged, and provided with information, to examine their own skin, whether they attend a workplace skin cancer check or not.
This sample Sun Protection Policy is intended as a guide only. Organisations should use this sample policy as a model when developing a Sun Protection Policy, and make amendments that suit the needs and practicalities of their own workplace.

Sun Protection Policy

**Rationale** Australia has the highest rate of skin cancer in the world. Despite being an almost entirely preventable disease, it continues to affect two in every three Australians before the age of 70. Of all new cancers diagnosed in Australia each year, 80% are skin cancers.

Workers who spend all or part of the day outdoors have a higher than average risk of skin cancer. This is because ultraviolet (UV) radiation from the sun is a known carcinogen.

All skin types can be damaged by exposure to UV radiation. Damage is permanent and irreversible, and increases with each exposure.

This organisation has an obligation under the Work Health and Safety Act 2011 (NSW) to ensure that the health and safety of workers and other people in the workplace is not put at risk from the work being carried out. This obligation includes taking proper steps to reduce the known health risks associated with exposure to UV radiation for outdoor workers.

**Aims**
This policy aims to:
- Provide appropriate sun protection control measures to ensure a safe working environment.
- Provide ongoing education that promotes personal responsibility for skin cancer prevention.

**Our commitment** This organisation will conduct a risk assessment to identify workers who have a high risk of exposure to UV radiation, and to identify work situations where exposure to UV radiation occurs.

This organisation will reduce workers’ exposure to UV radiation by requiring the use of sun protection measures by outdoor workers whenever the UV Index is 3 and above, and at all times when working outdoors for extended periods, in alpine regions, or near highly reflective surfaces.

**Engineering controls**
*Management will where possible:*
- Provide shaded areas or temporary shade for work.
- Encourage workers to move jobs to shaded areas.
- Provide indoor areas or shaded outdoor areas for rest/meal breaks.
- Consider applying window tinting to work vehicles.
- Move work away from reflective surfaces such as concrete slabs.
- Identify and minimise contact with photosensitising substances such as coal tar derivatives, dyes and chlorinated hydrocarbons.

**Administrative controls**
*When UV levels are 3 and above, management will where possible:*
- Schedule outdoor work tasks for earlier in the morning or later in the afternoon.
- Schedule indoor/shaded work tasks to occur in the middle part of the day.
- Encourage workers to rotate between indoor/shaded and outdoor tasks to avoid exposing any one individual to UV radiation for long periods of time.

**Personal protective equipment and clothing**
*Workers who work outdoors will be provided with the following personal protective equipment, which must be worn when working outdoors:*
- Long-sleeved shirt with a collar made from material with a ultraviolet protection factor (UPF) of 50+.
- Trousers (or knee-length shorts) made from UPF50+ material.
- A sun-protective hat that shades the face, head, ears and neck, is made from UPF50+ material, and is in a broad-brimmed, bucket or legionnaire style.
- Attachable brims and neck flaps when wearing a hard hat.
- Broad-spectrum, water-resistant sunscreen with a sun protection factor (SPF) of 30+ or higher, that is applied generously 20 minutes before going outdoors so that it can be absorbed, and reapplied at a minimum of every two hours. Sunscreen should be stored in a cool place (below 30°C) to prevent deterioration and reduction in effectiveness. The expiry date on the bottle should also be checked and adhered to.
- Sunglasses that are close fitting, have a wrap-around style and have an eye protection factor of 9 or 10, or meet Australian Standards (AS/NZS 1067:2003) or safety glasses (AS/NZS 1337.1:2010).
- A lip balm containing SPF30+ or higher is also recommended.
Note: these recommendations may need to be tailored if there is the risk that the use of recommended personal protective equipment may cause other safety concerns – for example, loose, long-sleeved shirts may pose a danger if worn while operating some machinery.

Education and training
Management will:
- Provide training to workers to enable them to work safely in the sun.
- Ensure that training is provided as part of induction for new workers.
- Ensure that workers are provided with information to effectively examine their own skin.
- Ensure that managers and supervisors act as positive role models.
- Adopt sun protection practices during all company social events.

Compliance
Management will:
- Ensure that the sun protection policy and requirements are made available to staff, contractors and visitors.
- Monitor the use of sun protection control measures to ensure compliance.
- Initiate standard company grievance procedures if a worker fails to comply with sun-protective control measures.
- Ensure that injury reporting procedures are followed when an incident of sunburn or excessive exposure to UV radiation occurs in the workplace.

Worker commitment
Workers will:
- Cooperate with all measures introduced by management to minimise the risks associated with exposure to UV radiation.
- Comply with instructions and advice in regards to the use of sun protection control measures.
- Participate in sun protection education programs.
- Act as positive role models.
- Be responsible for their own sun-protective practices at work.

Review
This policy will be reviewed on a regular basis, or at least every two years.

Explanation of terms and abbreviations

**ARPANSA:** Australian Radiation Protection and Nuclear Safety Agency.

**Carcinogen:** Any substance that can cause cancer.

**Employer:** For the purposes of this resource refers to ‘persons conducting a business or undertaking’ (PCBU), used in health and safety documentation in Australia, which is currently being updated.

**Erythema:** Reddening of the skin due to UV radiation exposure, as in sunburn.

**Eye protection factor (EPF):** A measure of the amount of protection against solar UV radiation provided by sunglasses that have been tested in accordance with Australian Standard, AS 1067: 2003.

**NOHSC:** National Occupational Health and Safety Commission.

**Outdoor worker:** A worker who in the course of their duties is required to work outdoors for part or all of the day.

**PPE:** Personal protective equipment and clothing.

**Skin cancer:** Cancer that starts in the cells of the skin. Types include basal cell carcinoma, which starts in the basal cells of the skin; squamous cell carcinoma, which starts in the squamous cells of the skin; and melanoma, which starts in the melanocytes of the skin.

**Solar radiation:** Electromagnetic radiation emitted by the sun. At the earth’s surface it consists of visible light, infrared radiation and ultraviolet radiation or UV radiation.

**Solar ultraviolet radiation (solar UV radiation):** Refers to the components of ultraviolet radiation emitted by the sun that reach the earth’s surface. It contains radiation in the range 290 to 400 nanometres. Wavelengths in the range 100 to 280 nanometres (all UVC and 90% of UVB) are completely absorbed in the atmosphere.

**Sunburn:** Reddening of the skin due to UV radiation exposure, also known as erythema.

**Sun protection:** Various health and safety issues can arise during outdoor work due to exposure to the sun. For the purpose of this booklet, the term sun protection refers to the modification of the work environment or use of equipment or clothing specifically to reduce exposure and protect against solar UV radiation.

**Sun protection factor (SPF):** A measure of the amount of protection provided by a sunscreen against solar UV radiation. SPF ratings are determined by testing sunscreens on the skin of human volunteers in accordance with Australian Standard AS2604: 2012.

**SunSmart UV Alert:** A tool which informs people about the times when UV Index levels will be high enough to damage the skin and when it is necessary to use sun protection measures. The SunSmart UV Alert is issued by the Bureau of Meteorology when the UV Index is forecast to reach 3 or above.

**Ultraviolet protection factor (UPF):** A measure of the UV radiation protection provided by fabric. UPF ratings are determined by testing fabrics in a laboratory in accordance with Australian Standard AS/ NZS 4399: 1996.

**Ultraviolet radiation (UV radiation or UV radiation):** Part of the electromagnetic spectrum emitted by the sun. Ultraviolet radiation refers to all ultraviolet radiation in the range 100 to 400 nanometres which can be further classified by wavelength into three regions: UVA, UVB and UVC.

**UVA:** Ultraviolet radiation in the range 315–400 nanometres.

**UVB:** Ultraviolet radiation in the range 280–315 nanometres.

**UVC:** Ultraviolet radiation in the range 100–280 nanometres.

**UV Index:** A unitless number that describes the amount of solar UV radiation that reaches the earth’s surface. The higher the UV Index, the more solar UV radiation present and the greater the potential for skin and eye damage.

**Worker:** Covers all staff with a verbal or written contract of employment or training. This includes direct workers, managers or supervisors, group training placements, apprentices, volunteers and work experience students. A worker also includes an independent contractor engaged by the employer, a sub contractor or a worker of that contractor, or a person whose services are provided to an employer by a labour hire or recruitment agency.
For further information on skin cancer prevention and sun protection please visit: cancercouncil.com.au/sunsmart
