

# Understanding Ovarian Cancer

*A guide for people with cancer, their families and friends*

For information & support, call **13 11 20**

## Understanding Ovarian Cancer

A guide for people with cancer, their families and friends

First published September 2003. This edition April 2022.  
© Cancer Council Australia 2022. ISBN 978 0 6452847 4 4

*Understanding Ovarian Cancer* is reviewed approximately every two years. Check the publication date above to ensure this copy is up to date.

Editor: Jenny Mothoneos. Designer: Ali Wright. Printer: IVE Group.

### Acknowledgements

This edition has been developed by Cancer Council NSW on behalf of all other state and territory Cancer Councils as part of a National Cancer Information Subcommittee initiative. We thank the reviewers of this booklet: Dr Nisha Jagasia, Gynaecological Oncologist, Mater Hospital Brisbane, QLD; Sue Hayes, Consumer; Bronwyn Jennings, Gynaecology Oncology Clinical Nurse Consultant, Mater Health, QLD; Dr Andrew Lee, Radiation Oncologist, Canberra Region Cancer Centre and Canberra Hospital, ACT; A/Prof Tarek Meniawy, Medical Oncologist, Sir Charles Gairdner Hospital, WA; Caitriona Nienaber, Cancer Council WA; Jane Power, Consumer; A/Prof Sam Saidi, Senior Staff Specialist, Gynaecological Oncology, Chris O'Brien Lifehouse, NSW. We also thank the health professionals and editorial teams who have worked on previous editions of this title.

### Note to reader

Always consult your doctor about matters that affect your health. This booklet is intended as a general introduction to the topic and should not be seen as a substitute for medical, legal or financial advice. You should obtain independent advice relevant to your specific situation from appropriate professionals, and you may wish to discuss issues raised in this book with them.

All care is taken to ensure that the information in this booklet is accurate at the time of publication. Please note that information on cancer, including the diagnosis, treatment and prevention of cancer, is constantly being updated and revised by medical professionals and the research community. Cancer Council Australia and its members exclude all liability for any injury, loss or damage incurred by use of or reliance on the information provided in this booklet.

### Cancer Council

Cancer Council is Australia's peak non-government cancer control organisation. Through the eight state and territory Cancer Councils, we provide a broad range of programs and services to help improve the quality of life of people living with cancer, their families and friends. Cancer Councils also invest heavily in research and prevention. To make a donation and help us beat cancer, visit [cancer.org.au](http://cancer.org.au) or call your local Cancer Council.

---

*Cancer Council acknowledges Traditional Custodians of Country throughout Australia and recognises the continuing connection to lands, waters and communities. We pay our respects to Aboriginal and Torres Strait Islander cultures and to Elders past, present and emerging.*

---

# About this booklet

This booklet has been prepared to help you understand more about ovarian cancer.

It is common to feel shocked and upset when told you have ovarian cancer. We hope this booklet will help you, your family and friends understand how ovarian cancer is diagnosed and treated. We also include information about support services.

We cannot give advice about the best treatment for you. You need to discuss this with your doctors. However, this information may answer some of your questions and help you think about what to ask your treatment team (see page 67 for a question checklist).

This booklet does not need to be read from cover to cover – just read the parts that are useful to you. Some medical terms that may be unfamiliar are explained in the glossary (see page 68). You may also like to pass this booklet to your family and friends for their information.

**How this booklet was developed** – The information in this booklet was developed with help from a range of health professionals and people affected by ovarian cancer. It is based on Australian and international clinical practice guidelines for ovarian cancer.<sup>1-2</sup>

If you or your family have any questions or concerns, call **Cancer Council 13 11 20**. We can send you more information and connect you with support services in your area. You can also visit your local Cancer Council website (see back cover).

# What is cancer?

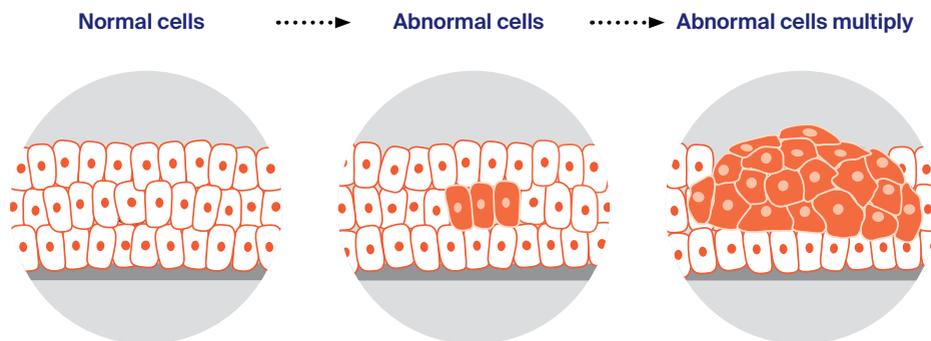

Cancer is a disease of the cells. Cells are the body's basic building blocks - they make up tissues and organs. The body constantly makes new cells to help us grow, replace worn-out tissue and heal injuries.

Normally, cells multiply and die in an orderly way, so that each new cell replaces one lost. Sometimes, however, cells become abnormal and keep growing. These abnormal cells may turn into cancer.

In solid cancers, such as ovarian cancer, the abnormal cells form a mass or lump called a tumour. In some cancers, such as leukaemia, the abnormal cells build up in the blood.

## How cancer starts

---

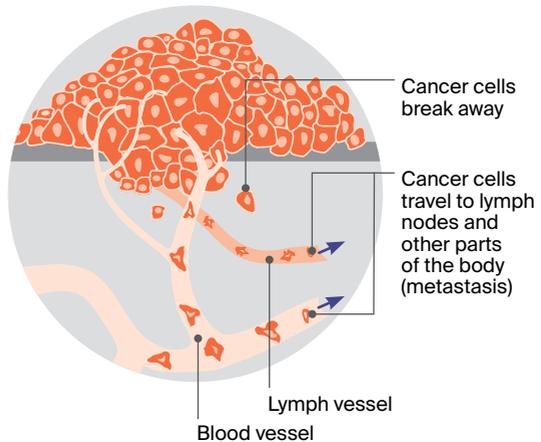

Not all tumours are cancer. Benign tumours tend to grow slowly and usually don't move into other parts of the body or turn into cancer. Cancerous tumours, also known as malignant tumours, have the potential to spread. They may invade nearby tissue, destroying normal cells. The cancer cells can break away and travel through the bloodstream or lymph vessels to other parts of the body.

The cancer that first develops in a tissue or organ is called the primary cancer. It is considered localised cancer if it has not spread to other parts of the body. If the primary cancer cells grow and form another tumour at a new site, it is called a secondary cancer or metastasis. A metastasis keeps the name of the original cancer. For example, ovarian cancer that has spread to the liver is called metastatic ovarian cancer, even though the main symptoms may be coming from the liver.

## How cancer spreads

### .....▶ Malignant cancer

# The ovaries

The ovaries are part of the female reproductive system, which also includes the fallopian tubes, uterus (womb), cervix (the neck of the uterus), vagina (birth canal) and vulva (external genitals).

The ovaries are two small, walnut-shaped organs. They are found in the lower part of the abdomen (belly). There is one ovary on each side of the uterus, close to the end of the fallopian tubes.

Each ovary is made up of:

- epithelial cells – found on the outside of the ovary in a layer known as the epithelium
- germ (germinal) cells – found inside the ovaries; eventually mature into eggs (ova)
- stromal cells – form connective (supporting) tissue within the ovaries, and make the hormones oestrogen and progesterone.

**Menstruation** – Each month, from puberty to menopause, the ovaries release an egg (ovum). This is known as ovulation. The egg travels from the fallopian tube to the uterus. If the egg is fertilised by a sperm, it attaches to the lining of the uterus and grows into a baby. If the egg is not fertilised, the lining of the uterus is shed and flows out of the body through the vagina. This flow is known as a period or menstruation.

**Menopause** – The hormones oestrogen and progesterone control ovulation and menstruation. As you get older, the ovaries gradually make less of these hormones. When the levels of oestrogen and progesterone fall low enough, periods finally stop. This is known as menopause. After menopause, you can't have a child naturally.

# The female reproductive system

---

## Front view

## Organs near the ovaries

---

Near the ovaries are many organs and other structures, including the:

- bladder – stores urine or wee
- small bowel – involved in digestion
- rectum – stores faeces or poo
- peritoneum – the lining of the abdomen
- omentum – the sheet of fatty tissue that hangs in front of the large bowel like an apron.

### Side view

# Key questions

## Q: What is ovarian cancer?

**A:** Ovarian cancer starts when cells in one or both ovaries, the fallopian tubes or the peritoneum become abnormal, grow out of control and form a lump called a tumour. Cancer of the fallopian tube was once thought to be rare, but recent research suggests that many ovarian cancers start in the fallopian tubes. There are different types of ovarian cancer – see table, next page.

If ovarian cancer spreads beyond the ovaries, it often spreads to the organs in the abdomen and pelvis – see diagram opposite.

Sometimes an ovarian tumour is diagnosed as a borderline tumour (also known as a low malignant potential tumour). This tumour is not considered to be cancer but can still spread within the abdomen – see table, next page.

## Q: How common is it?

**A:** Each year, about 1720 Australians are diagnosed with ovarian cancer – this includes serous carcinomas of the fallopian tube. Over 80% of people diagnosed are over the age of 50, but ovarian cancer can occur at any age. It is the 9th most common cancer in females in Australia.<sup>3-4</sup>

Anyone with ovaries can get ovarian cancer, so it mostly affects women. Transgender men and intersex people can also get ovarian cancer if they have ovaries. For information specific to you, speak to your doctor.

## What are the different types of ovarian cancer?

There are many types of ovarian cancer. The three main types start in different cells: epithelial, stromal or germ cells.

<b>epithelial</b>	<ul style="list-style-type: none"><li>• the most common type of ovarian cancer (about 90% of cases)</li><li>• starts on the surface of the ovary (epithelium), fallopian tube or peritoneum</li><li>• subtypes include serous, endometrioid, clear cell, and mucinous</li><li>• serous is the most common subtype; it's divided into high grade and low grade (see page 23)</li><li>• most high-grade serous ovarian cancers start in cells at the end of the fallopian tube</li><li>• mostly occurs over the age of 60</li></ul>
<b>stromal cell (or sex cord-stromal tumours)</b>	<ul style="list-style-type: none"><li>• rare cancer (8% or less)</li><li>• starts in the cells in the ovaries that produce the hormones oestrogen and progesterone</li><li>• may produce extra hormones, such as oestrogen</li><li>• usually occurs between the ages of 40 and 60</li></ul>
<b>germ cell</b>	<ul style="list-style-type: none"><li>• rare type of ovarian cancer (about 4% of cases)</li><li>• starts in the egg-producing (germinal) cells</li><li>• usually occurs under the age of 40</li></ul>

## Non-cancerous ovarian tumour

<b>borderline tumour</b>	<ul style="list-style-type: none"><li>• abnormal cells that form in the tissue covering the ovary</li><li>• doesn't grow into the supportive tissue (stroma)</li><li>• grows slowly</li></ul>
--------------------------	---

## Q: What are the symptoms?

- A:** The symptoms of ovarian cancer can be similar to other common conditions. This can make it difficult to diagnose early. Symptoms are more likely to develop as the cancer grows and may include:
- pressure, pain or discomfort in the abdomen or pelvis
  - a swollen or bloated abdomen
  - changes in appetite (e.g. not feeling like eating, feeling full quickly)
  - changes in toilet habits (e.g. constipation, diarrhoea, passing urine more often, increased wind)
  - indigestion and feeling sick (nausea)
  - feeling very tired
  - unexplained weight loss or weight gain
  - changes to periods such as heavy or irregular bleeding, or vaginal bleeding after menopause
  - pain when having sex.

If you have any of these symptoms and they are new for you, are severe or continue for more than a few weeks, it is best to have a check-up. Keep a note of how often the symptoms occur and make an appointment to see your general practitioner (GP).

Ovarian Cancer Australia has produced a symptom diary for recording symptoms. You can also use it to help talk about your health concerns with your doctor. Visit [ovariancancer.net.au/signs-and-symptoms](http://ovariancancer.net.au/signs-and-symptoms) to download a PDF that you can print out.

For an overview of what to expect at every stage of your cancer care, visit [cancer.org.au/cancercareguides/ovarian-cancer](http://cancer.org.au/cancercareguides/ovarian-cancer). This is a short guide to what is recommended, from diagnosis to treatment and beyond.

## Q: What are the risk factors?

**A:** The causes of ovarian cancer are largely unknown, but factors that can increase the risk of developing ovarian cancer include:

- **age** – ovarian cancer is most common in women over 50 and in women who have stopped having periods (have been through menopause), and the risk increases with age
- **genetic factors** – up to 20% of serous ovarian cancers (the most common subtype) are linked to an inherited faulty gene, and a smaller proportion of other types of ovarian cancer are also related to genetic faults (see opposite page)
- **family history** – having one or more close blood relatives (e.g. mother, sister) diagnosed with ovarian, breast, bowel or uterine cancers, or having Ashkenazi Jewish ancestry
- **endometriosis** – this condition is caused by tissue from the lining of the uterus growing outside the uterus
- **reproductive history** – women who have not had children, who have had assisted reproduction (e.g. in-vitro fertilisation or IVF), or who have had children after the age of 35 may be slightly more at risk
- **lifestyle factors** – some types of ovarian cancer have been linked to smoking or being overweight
- **hormonal factors** – such as early puberty or late menopause. Some studies suggest that menopause hormone therapy (MHT), previously called hormone replacement therapy (HRT), may increase the risk of ovarian cancer, but the evidence is not clear.

Some factors reduce the risk of developing ovarian cancer. These include having children before the age of 35; breastfeeding; using the combined oral contraceptive pill for several years; and having your fallopian tubes tied (tubal ligation) or removed.

## Q: Does ovarian cancer run in families?

**A:** Ovarian cancer most often occurs for unknown reasons (see opposite page). But some cases are due to an inherited faulty gene. Having an inherited faulty gene does not mean you will definitely develop ovarian cancer, and you can inherit a faulty gene without having a history of cancer in your family.

About 15% of women with ovarian cancer have an inherited fault in the BRCA1 or BRCA2 genes or other similar genes. The BRCA gene faults can also increase the risk of developing breast cancer.

Less commonly, a group of gene faults known as Lynch syndrome is associated with ovarian cancer and can also increase the risk of developing cancer of the bowel or uterus.

As other genetic conditions are discovered, they may be included in genetic tests for cancer risk. See page 19 for more information.

▶ Listen to our podcast episode “Genetic Tests and Cancer”.

## Q: Which health professionals will I see?

**A:** Your general practitioner (GP) will arrange the first tests to assess your symptoms. If these tests do not rule out cancer, you will usually be referred to a specialist called a gynaecological oncologist. The specialist will arrange further tests.

If ovarian cancer is diagnosed, the specialist will consider treatment options. Often these will be discussed with other health professionals at what is known as a multidisciplinary team (MDT) meeting. During and after treatment, you will see a range of health professionals who specialise in different aspects of your care.

## Health professionals you may see

<b>GP</b>	assists you with treatment decisions and works in partnership with your specialists in providing ongoing care
<b>gynaecological oncologist*</b>	diagnoses and performs surgery for cancers of the female reproductive system, e.g. ovarian, cervical, uterine, vulvar and vaginal cancers
<b>gynaecological pathologist*</b>	examines tissue removed from the abdomen or ovaries under a microscope
<b>medical oncologist*</b>	treats cancer with drug therapies such as chemotherapy and targeted therapy (systemic treatment)
<b>radiation oncologist*</b>	treats cancer by prescribing and overseeing a course of radiation therapy
<b>radiation therapist</b>	plans and delivers radiation therapy
<b>radiologist*</b>	reads and interprets diagnostic scans, such as x-rays and CT and PET scans
<b>cancer care coordinator</b>	coordinates your care, liaises with other members of the MDT and supports you and your family throughout treatment; care may also be coordinated by a clinical nurse consultant (CNC) or clinical nurse specialist (CNS)
<b>nurse</b>	administers drugs and provides care, information and support throughout treatment

<b>occupational therapist</b>	assists in adapting your living and working environment to help you resume usual activities after treatment
<b>physiotherapist</b>	helps with restoring movement and mobility, and preventing further injury
<b>exercise physiologist</b>	prescribes exercise to help people with medical conditions improve their overall health, fitness, strength and energy levels
<b>dietitian</b>	helps with nutrition concerns and recommends changes to diet during treatment and recovery
<b>social worker</b>	links you to support services and helps you with emotional, practical and financial issues
<b>counsellor</b>	helps you manage your emotional response to diagnosis and treatment
<b>clinical psychologist</b>	uses evidence-based strategies to help you manage emotional conditions, usually in the long term
<b>palliative care specialists* and nurses</b>	work closely with the GP and cancer specialists to help control symptoms and maintain quality of life
<b>family cancer specialist*, genetic counsellor</b>	provide advice about genetic causes of ovarian cancer; arrange genetic tests if required and interpret the results for you and your family

*\* Specialist doctor*

# Diagnosis

If your doctor suspects you have ovarian cancer, they will usually start with a pelvic examination, then order some of the tests and scans described in this chapter. To confirm the diagnosis, tissue from the tumour needs to be checked under a microscope. This tissue can be obtained with a biopsy (piece of tissue or fluid sample from the abdomen – see pages 21–22) or at the time of surgery (see page 30).

Sometimes ovarian cancer is diagnosed before it causes symptoms. This is usually when abnormalities are found during tests or procedures for another health condition.

## Pelvic examination

In a pelvic examination, the doctor will press gently on different parts of the outside of your abdomen (belly) to feel for any masses or lumps. To check your uterus and ovaries, the doctor will place two gloved fingers into your vagina while pressing on your abdomen with their other hand. You may also have a vaginal examination using an instrument that gently separates the walls of the vagina.

A pelvic examination is not painful but it may be uncomfortable. There might be another health professional in the room or, if there isn't, you can ask for a staff member or a family member or friend to be present during the examination if you prefer.

The doctor may also perform a digital rectal examination, placing a gloved finger into the anus and rectum. This lets the doctor feel the tissue behind the uterus where cancer cells may grow.

Screening tests look for some types of cancer in people who do not have any symptoms. At present, there is no effective screening test for ovarian cancer. The cervical screening test (which replaced the Pap test in 2017) looks for human papillomavirus (HPV). This virus causes most cases of cervical cancer but not ovarian cancer. Neither the cervical screening test nor the Pap test can help find ovarian cancer.

## Blood tests

You may have blood tests to check for proteins produced by cancer cells. These proteins are called tumour markers. The most common tumour marker for ovarian cancer is CA125. The level of CA125 may be higher in some cases of ovarian cancer. It can also rise for reasons other than cancer, including ovulation, menstruation, irritable bowel syndrome, liver or kidney disease, endometriosis or fibroids.

The CA125 blood test is not used to screen for ovarian cancer if you do not have any symptoms. It can be used in the following ways:

**At diagnosis** – A CA125 test is more accurate in diagnosing ovarian cancer if you have been through menopause. If you have early-stage ovarian cancer, CA125 levels are often normal. This is why doctors will often combine CA125 tests with an ultrasound (see next page).

**During treatment** – For ovarian cancer that produces CA125, the blood test may be one way to check how well treatment is working. Falling CA125 levels may mean it is working, and rising CA125 levels may mean the treatment is not working well.

**After treatment** – CA125 blood tests are sometimes included in follow-up tests. See page 61 for more information.

## Imaging scans

Your doctor may recommend a number of imaging scans to look for any pelvic mass, but they don't confirm if any mass found is cancer. Imaging scans can also work out how far the cancer has spread.

### Pelvic ultrasound

A pelvic ultrasound uses soundwaves to create a picture of your uterus and ovaries. The soundwaves echo when they meet something dense, like an organ or tumour, then a computer creates a picture from these echoes. A technician called a sonographer does the scan. A pelvic ultrasound appointment usually takes 15–30 minutes.

A pelvic ultrasound can be done in two ways:

**Abdominal ultrasound** – To get good pictures of the uterus and ovaries, the bladder needs to be full, so you will be asked to drink water before the appointment. You will lie on an examination table while the sonographer moves a small handheld device called a transducer over your abdomen.

**Transvaginal ultrasound** – The sonographer inserts a small transducer wand into your vagina. It will be covered with a disposable plastic cover and gel to make it easier to insert. You may find a transvaginal ultrasound uncomfortable, but it should not be painful. If you feel embarrassed or concerned about having this procedure, you can ask for a female sonographer or have someone in the room with you (e.g. your partner, a friend or a relative) if that makes you feel more comfortable.

The transvaginal ultrasound is often the preferred type of ultrasound, as it provides a clearer picture of both the ovaries and uterus.

## Genetic testing after diagnosis

---

If you are diagnosed with epithelial ovarian cancer, your treatment team or a family cancer centre will discuss with you the option to have a blood test to look for a fault in the BRCA1, BRCA2 or another similar gene. This genetic test may be available through the public hospital system or with a Medicare rebate. The results will help work out if the ovarian cancer is sensitive to treatments such as targeted therapy (see pages 42–43).

If a cancer-related gene fault is found, Medicare rebates the cost of testing close adult female and male relatives to check their risk. (Men can inherit and pass on BRCA faults and may have a higher risk of prostate cancer.)

For more information, listen to our podcast episode on genetic tests, and visit [Ovarian Cancer Australia at ovariancancer.net.au](http://OvarianCancerAustralia.com.au) to order their booklet on genetic testing.

---

## CT scan

A CT (computerised tomography) scan uses x-rays to create a detailed picture of the inside of the body. A CT scan is used to:

- check your abdomen, chest and pelvic area
- look for signs that the cancer has spread outside the ovaries
- guide the needle when doing a biopsy.

The CT scanner is a large, doughnut-shaped machine. You will lie on a table that moves in and out of the scanner. CT scans are usually done at a hospital or radiology clinic.

You will be asked to not eat or drink (fast) before the scan. You may need to have an injection of a special dye. This dye is called contrast and it makes your organs appear white in the pictures so anything unusual can be seen more clearly.

While a CT scan can be noisy, it is painless. The contrast may make you feel hot all over and leave a bitter taste in your mouth, and you may feel a sudden urge to pass urine. These sensations usually pass quickly, but tell the person carrying out the scan if they don't go away.

The scan takes about 10-20 minutes, but it may take extra time to prepare and then wait for the scan. You usually go home as soon as the CT scan is over.

## **PET-CT scan**

A PET (positron emission tomography) scan combined with a CT scan is a specialised imaging test. It provides more information about the activity of the cancer than a CT scan on its own, which mainly shows the shape and size of the tumours.

Only some people need a PET-CT scan. Medicare covers the cost of PET scans only for ovarian cancer that has returned, so they are not often used to look for ovarian cancer. If you are having chemotherapy before surgery, you may have this scan before the operation.

To prepare for a PET-CT scan, you will be asked not to eat or drink for a period of time (fast). Before the scan, you will be injected with a glucose solution containing a small amount of radioactive material. Cancer cells show up brighter on the scan because they take up more glucose than normal cells do.

You will be asked to sit quietly for 30-90 minutes as the glucose spreads through your body, then you will have the scan. The scan itself will take about 30 minutes. Let your doctor know if you are claustrophobic, as you need to be in a confined space for the scan. Any radiation will leave your body within a few hours.

Before having scans, tell the doctor if you have any allergies or have had a reaction to contrast during previous scans. You should also let them know if you have diabetes or kidney disease, or are pregnant or breastfeeding.

## MRI scan

An MRI (magnetic resonance imaging) scan uses a powerful magnet and radio waves to build up detailed pictures of the inside of your body. While not often used, an MRI may help if it is difficult to tell from the ultrasound whether an ovarian tumour is likely to be cancerous.

If you are having an MRI scan, let your medical team know if you have a pacemaker. The magnet can interfere with some pacemakers, but newer pacemakers are often MRI-compatible. As with a CT scan, a contrast dye might be injected into your veins before an MRI scan.

During the scan, you will lie on a bench inside a large metal tube that is open at both ends. The noisy, narrow machine makes some people feel anxious or claustrophobic. If you think you may become distressed, mention it beforehand to your medical team. You may be given a medicine to help you relax, and you will usually be offered headphones or earplugs. The MRI scan may take between 30 and 90 minutes.

## Taking a biopsy

The only way to confirm the diagnosis of ovarian cancer is to remove a sample of tissue from the tumour (biopsy). This is sent to a specialist called a pathologist who checks it under a microscope for cancer cells.

In some cases, the diagnosis is confirmed after tissue is removed during surgery (see page 30). If you cannot have surgery because the cancer

has spread or because of some other medical condition, a biopsy may be taken in a different way.

## **Image-guided biopsy**

A CT scan is used to guide where to put the needle. This is called an image-guided biopsy. You have a local anaesthetic injection in the skin over the area so that it goes numb. The procedure takes about 10 to 20 minutes. The cells in the sample will then be checked under a microscope to get more information about the cancer.

## **Removing a fluid sample**

Sometimes fluid can build up in the abdomen. This is called ascites. If you have ascites, samples of the fluid can be removed and tested for cancer cells. The skin of the abdomen will be numbed and a needle will be inserted to collect some fluid. A CT scan may be used to guide the needle into place. The fluid is sent to a laboratory to check if it contains cancer cells.

## **Staging ovarian cancer**

The tests described on pages 16–22 help show whether you have ovarian cancer and whether it has spread to other parts of the body. This process is called staging and it helps your health care team recommend the best treatment for you.

The staging system most commonly used for ovarian cancer is the International Federation of Gynecology and Obstetrics (FIGO) system (see table opposite). It divides ovarian cancer into four stages.

- Stages 1–2 mean it is early ovarian cancer.
- Stages 3–4 mean the cancer is advanced. About 7 out of 10 cases of ovarian cancer are diagnosed at stage 3 or 4.

## Stages of ovarian cancer

The four stages of ovarian cancer in the FIGO system may be divided into sub-stages, such as A, B, C, which indicate increasing amounts of tumour.

<b>stage 1</b>	Cancer is in one or both ovaries or fallopian tubes only.
<b>stage 2</b>	Cancer is in one or both ovaries or fallopian tubes and has spread to other organs in the pelvis (uterus, bladder or bowel).
<b>stage 3</b>	Cancer is in one or both ovaries or fallopian tubes and has spread outside the pelvis to the lining of the abdomen (peritoneum) or to nearby lymph nodes.
<b>stage 4</b>	The cancer has spread outside the abdomen to distant organs such as the lungs or liver.

## Grading ovarian cancer

The cancer will also be given a grade. This is a score that describes how the cancer cells look compared to normal cells under a microscope. The grade suggests how quickly the cancer may grow.

Different systems are used to grade ovarian cancer. The system used depends on the type of ovarian cancer.

Epithelial ovarian cancer is simply divided into low grade and high grade and a number is not given. The most common type of ovarian cancer is high-grade serous cancer. All other types of ovarian cancers are graded as 1, 2 and 3 – 1 being low grade and 3 being high grade.

## Prognosis

Prognosis means the expected outcome of a disease. You may wish to discuss your prognosis and treatment options with your doctor, but it is not possible for anyone to predict the exact course of the disease.

To work out your prognosis, your doctor will consider test results; the type of ovarian cancer and its stage and grade; genetic factors (see page 19); likelihood of response to treatment; and factors such as your age, fitness and overall health.

**Epithelial cancer** – If epithelial ovarian cancer is diagnosed and treated when the cancer is inside the ovary (stage 1), it has a good prognosis. Many cases of more advanced cancer may respond well to treatment, but the cancer often comes back (recurs) and further treatment is needed.

**Stromal cell and germ cell tumours** – These can usually be treated successfully, although there may be a small risk the cancer will come back and need further treatment.

**Borderline tumour** – This can usually be treated successfully with surgery alone.

Discussing your prognosis can be challenging and stressful. It may help to talk with family and friends. You can also call Cancer Council 13 11 20.

▶ Listen to our podcast episode “Coping with a Cancer Diagnosis”.

## Key points about diagnosing ovarian cancer

---

### Getting a diagnosis

- There is no effective screening test for ovarian cancer at present.
- Most ovarian cancers have spread outside the ovary before they are diagnosed.
- If you have symptoms, you may have a range of tests and scans to look for signs of cancer.
- In most cases, the only way to confirm a diagnosis of ovarian cancer is to take a tissue sample (biopsy).

---

### Tests and scans

- The doctor may feel your abdomen and do internal examinations of the vagina and rectum to check for masses or lumps.
- Blood tests will be done to look for tumour markers such as CA125.
- An ultrasound scan uses soundwaves to create a picture of the ovaries.
- A CT scan looks for signs that the cancer has spread. It may not find all tumours.
- Other tests sometimes used to check for cancer spread include PET-CT and MRI scans.

---

### Staging and prognosis

- Results of the tests and biopsy help your doctors work out if and how far the cancer has spread. This is known as the stage.
- The grade describes how similar the cancer cells look to normal cells.
- A prognosis is a disease's expected outcome. Early-stage cancer has a better prognosis than advanced-stage cancer.

# Making treatment decisions

Sometimes it is difficult to decide on the type of treatment to have. You may feel that everything is happening too fast, or you might be anxious to get started.

Check with your specialist how soon treatment should begin, as it may not affect the success of the treatment to wait a short time. Ask them to explain the options, and take as much time as you can before making a decision.

**Know your options** – Understanding the disease, the available treatments, possible side effects and any extra costs can help you weigh up the options and make a well-informed decision. Check if the specialist is part of a multidisciplinary team (see page 13) and if the treatment centre is the most appropriate one for you – you may be able to have treatment closer to home, or it might be worth travelling to a centre that specialises in a particular treatment.

**Record the details** – When your doctor first says you have cancer, you may not remember everything you are told. Taking notes can help. If you would like to record the discussion, ask your doctor first. It is a good idea to have a family member or friend go with you to appointments to join in the discussion, write notes or simply listen.

**Ask questions** – If you are confused or want to check anything, it is important to ask your specialist questions. Try to prepare a list before appointments (see page 67 for suggestions). If you have a lot of questions, you can also talk to a cancer care coordinator or nurse.

**Consider a second opinion** – You may want to get a second opinion from another specialist to confirm or clarify your specialist's recommendations or reassure you that you have explored all of your options. Specialists are used to people doing this. Your GP or specialist can refer you to another specialist and send your initial results to that person. You can get a second opinion even if you have started treatment or still want to be treated by your first doctor. You might decide you would prefer to be treated by the second specialist.

**It's your decision** – Adults have the right to accept or refuse any treatment that they are offered. For example, some people with advanced cancer choose treatment that has significant side effects even if it gives only a small benefit for a short period of time. Others decide to focus their treatment on quality of life. You may want to discuss your decision with the treatment team, GP, family and friends.

► See our *Cancer Care and Your Rights* booklet.

## Should I join a clinical trial?

---

Your doctor or nurse may suggest you take part in a clinical trial. Doctors run clinical trials to test new or modified treatments and ways of diagnosing disease to see if they are better than current methods. For example, if you join a randomised trial for a new treatment, you will be chosen at random to receive either the best existing treatment or the modified new treatment. Over the years, trials have improved treatments and

led to better outcomes for people diagnosed with cancer.

You may find it helpful to talk to your specialist, clinical trials nurse or GP, or to get a second opinion. If you decide to take part in a clinical trial, you can withdraw at any time. For more information, visit [australiancancertrials.gov.au](http://australiancancertrials.gov.au).

► See our *Understanding Clinical Trials and Research* booklet.

# Treatment

The treatment for ovarian cancer depends on the type of ovarian cancer you have, the stage of the cancer, whether you wish to have children, whether you have a gene fault (see page 19), your general health and fitness, and your doctors' recommendations.

Ovarian cancer is most often treated with surgery and chemotherapy, either on their own, or in combination. Whether you have surgery or chemotherapy first will depend on several factors. Targeted therapy drugs may be offered if you have certain genes changes in your tumour and/or if you have advanced cancer that could not be completely removed with surgery.

## Treatment options by type of ovarian cancer

<b>epithelial – stage 1</b>	<ul style="list-style-type: none"><li>• usually treated with surgery alone</li><li>• may be offered chemotherapy after surgery if there is a high risk of the cancer coming back</li></ul>
<b>epithelial – stages 2, 3 and 4</b>	<ul style="list-style-type: none"><li>• usually treated with a combination of surgery and chemotherapy</li><li>• new targeted therapy drugs are being offered to people with a BRCA gene fault</li><li>• rarely, radiation therapy is offered</li></ul>
<b>stromal cell</b>	<ul style="list-style-type: none"><li>• usually treated with surgery, sometimes followed by chemotherapy or targeted therapy</li></ul>
<b>germ cell</b>	<ul style="list-style-type: none"><li>• usually treated with surgery or chemotherapy or both</li></ul>
<b>borderline tumour</b>	<ul style="list-style-type: none"><li>• usually treated with surgery only</li></ul>

## Other treatment options

---

Some women with ovarian cancer may feel that they are not given as many options for treatment as there are for other types of cancer. Currently there are several treatment options for ovarian cancer that have been proven to work.

Research is continuing into treatments for ovarian cancer.

In some cases, you may be able to join a clinical trial (see page 27) to access new treatments that are being investigated.

---

## Surgery

Surgery for ovarian cancer is complex. It is recommended that a gynaecological oncologist who is at a hospital that does a lot of these operations (high-volume centre) performs the surgery. To find out more, visit [asgo.net.au/is-there-a-gynaecologist-oncologist-near-you](http://asgo.net.au/is-there-a-gynaecologist-oncologist-near-you).

Surgery allows your gynaecological oncologist to confirm the diagnosis of ovarian cancer and work out how far the cancer has spread.

Your gynaecological oncologist will talk to you about the most suitable type of surgery, as well as the risks and side effects. These may include infertility. If having children is important to you, talk to your doctor before surgery and ask for a referral to a fertility specialist (see page 48).

## How the surgery is done

You will be given a general anaesthetic and will have either a laparoscopy (with 3–4 small cuts in your abdomen) or a laparotomy (with a vertical cut from around your bellybutton to your pubic line). A laparoscopy may be used to see if a suspicious mass is cancerous; if the cancer is advanced, you will usually have a laparotomy.

## Having a surgical biopsy

You may have a biopsy during surgery if you cannot have an image-guided biopsy (see page 22), or to remove and check a suspicious tumour. The tissue samples are sent to a pathologist, who checks them for signs of cancer. The results will help decide if you need debulking surgery.

## Debulking

If cancer is found, the surgeon will remove as much cancer as possible. This is called debulking or cytoreductive surgery. You may also have chemotherapy before or after surgery.

Debulking usually means removing the ovaries, fallopian tubes, uterus and cervix (see opposite). Depending on how far the cancer has spread, other organs or tissue may also be removed during the same operation.

**Omentectomy** – The omentum is a sheet of fatty tissue that hangs down in front of the large bowel like an apron (see page 8). If the cancer has spread to the omentum, it will need to be removed.

**Lymphadenectomy** – Cancer cells can spread from your ovaries to nearby lymph nodes. Your doctor may suggest removing some in a lymphadenectomy (also called lymph node dissection).

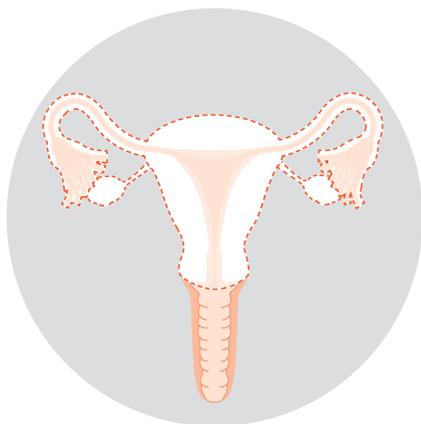

**Colectomy** – If cancer has spread to the bowel, some of the bowel may need to be removed. Rarely, a new opening called a stoma might be created (colostomy or ileostomy). See page 53 for more details.

**Removal of other organs** – Ovarian cancer can spread to many organs in the abdomen. In some cases, parts of the liver, diaphragm, bladder and spleen may be removed if it is safe to do so.

## Types of surgery

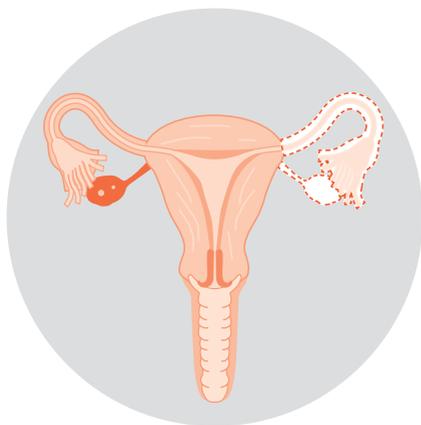

If ovarian cancer is found, all or some of the reproductive organs will be removed. The type of surgery you have will depend on how certain the gynaecological oncologist is that cancer is present and where the cancer has spread.

### **Total hysterectomy and bilateral salpingo-oophorectomy**

In most cases, surgery for ovarian cancer means removing the uterus and cervix, along with both fallopian tubes and ovaries.

Removing the uterus will mean you cannot carry a child.

### **Unilateral salpingo-oophorectomy**

If cancer is found early and it is in one ovary, you may have only one ovary and fallopian tube removed.

This is suggested for some young women who still wish to have children.

## What to expect after surgery

When you wake up after the operation, you will be in a recovery room near the operating theatre or in the intensive care unit. Once you are fully conscious, you will be taken back to your bed on the hospital ward. The surgeon will visit you as soon as possible to explain the results of the operation.

**Tubes and drips** – You are likely to have several tubes in place, which will be removed as you recover:

- a drip inserted into a vein in your arm (intravenous drip) will give you fluid, medicines and pain relief
- a small plastic tube (catheter) may be inserted into your bladder to collect urine in a bag
- a tube may be inserted down your nose into your stomach (nasogastric tube) to drain stomach fluid and prevent vomiting
- tubes may be inserted in your abdomen to drain fluid from the site of the operation.

**Pain** – As with all major surgery, you will have some discomfort or pain, but this can be controlled. For the first day or two, you may be given pain medicine through a:

- drip into a vein (intravenous drip)
- local anaesthetic injection into the abdominal wall (a transverse abdominis plane or TAP block) or into the spine (an epidural)
- patient-controlled analgesia (PCA) system - you press a button to give yourself a measured dose of pain relief.

Let your doctor or nurse know if you are in pain so they can adjust your medicines to make you as comfortable as possible. Pain that is treated early is better managed. After you go home, you can continue taking pain medicines as needed.

## Pain in the shoulder

---

During a laparoscopy, carbon dioxide gas is used to inflate the abdomen. The gas can irritate nearby nerves. This can cause pain in the lower chest and up into the shoulder area, which is known as

“referred pain”. This type of pain can be quite uncomfortable and may last several days. Walking and mild pain medicines can help ease the pain in the shoulder. Applying heat to the area may also help.

---

**Blood clot prevention** – You will be encouraged to move around as soon as you can. It is common to be given a daily injection of a blood thinner to reduce the risk of blood clots. Depending on your risk of clotting, you may be taught to give this injection to yourself so you can continue it for a few weeks at home. You may also be advised to wear compression stockings for 2-3 weeks to help the blood in your legs to circulate and avoid clots.

**Wound care** – You can expect some light vaginal bleeding after the surgery, which should stop within two weeks. Your treatment team will talk to you about how you can keep the wound clean to prevent infection once you go home.

If you had part of the bowel removed and have a stoma (see page 53), a stomal therapy nurse will explain how to manage it.

**Length of stay** – You will stay in hospital for 1-4 days. How long you stay will depend on the type of surgery you had and how quickly you recover. If you had laparoscopic surgery, you will be able to go home on the first or second day after the operation.

▶ See our *Understanding Surgery* booklet.

## Taking care of yourself at home after surgery

Your recovery time will depend on the type of surgery you had, your general health, and your support at home. If you don't have support from family, friends or neighbours, ask your nurse or the hospital social worker if it's possible to get

### Rest up

When you get home from hospital, take things easy and do only what is comfortable. You may like to try meditation or some relaxation techniques to reduce anxiety or tension.

### Lifting

Avoid heavy lifting (more than 3–4 kg) or heavy work (e.g. gardening) for at least 4 weeks. This will depend on the method of the surgery.

### Work

Depending on the type of work you do, you will probably need time off work. Ask your treatment team how long this might be.

### Driving

You will need to avoid driving after the surgery until pain in no way limits your ability to move freely. Discuss this issue with your doctor. Check with your car insurer for any exclusions regarding major surgery and driving.

help at home. In most cases, you will feel better within 1–2 weeks and should be able to fully return to your usual activities after 4–8 weeks. Ask your treatment team for more information about your particular circumstances.

## Eat well

To help your body recover from surgery, eat a well-balanced diet that includes a variety of foods. Include proteins such as lean meat, fish, eggs, milk, yoghurt, nuts, and legumes/beans.

## Bowel problems

You may have constipation after having a hysterectomy and taking strong pain medicines. You will probably be offered stool softeners while you're taking pain medicines and until your bowel movements return to normal.

## Exercise

Your treatment team will probably encourage you to walk the day of the surgery. Research suggests that exercise helps manage some treatment side effects and speed up a return to usual activities. Speak to your doctor about suitable exercise and ask for a referral to an exercise physiologist. To avoid infection, it's best to avoid swimming for 4–5 weeks after surgery.

## Sex

Sexual intercourse should be avoided for up to 8 weeks after a hysterectomy. Ask your doctor or nurse when you can have sex again, and explore other ways you and your partner can be intimate, such as massage.

## Will I need further treatment after surgery?

---

All tissue and fluids removed during surgery are checked for cancer cells by a pathologist. The results will help confirm the type of ovarian cancer you have, if it has spread (metastasised), and its stage.

Your doctor should have all the test results within two weeks of surgery.

Further treatment will depend on the type, stage and grade of the cancer.

If the cancer is advanced, it's more likely to come back, so surgery will usually be followed by chemotherapy, and occasionally by targeted therapy. Radiation therapy is recommended only in particular cases.

---

## Chemotherapy

Chemotherapy is the treatment of cancer with anti-cancer (cytotoxic) drugs. The aim is to destroy cancer cells while causing the least possible damage to normal, healthy cells.

When you have chemotherapy depends on the stage of the cancer. It may be used at different times:

**Before surgery** – For stage 3 or 4 ovarian cancer, chemotherapy is sometimes given before surgery. This is known as neoadjuvant chemotherapy. The aim is to shrink the tumours to make them easier to remove.

After three cycles of chemotherapy, you will have a CT scan to check how the tumour has responded to the chemotherapy. Your doctor will then decide about having an operation. If you have surgery, you will have another three cycles of chemotherapy afterward. If you do not have surgery, you will continue with a further three cycles of chemotherapy.

**After surgery** – Chemotherapy is usually given 2–4 weeks after the surgery (adjuvant chemotherapy) as there may be some cancer cells still in the body. For ovarian cancer, the drugs are usually given in repeating cycles spread over 4–5 months, but this can vary depending on the stage of the cancer and your general health. Your treatment team will talk to you about your specific schedule. Some people may have chemotherapy with a targeted therapy drug (see pages 42–43).

**Main treatment** – Chemotherapy may be recommended as the main treatment if you are not well enough for a major operation or when the cancer cannot be surgically removed.

## Having chemotherapy

Chemotherapy is usually given as a combination of two or more drugs, or sometimes as a single drug.

In most cases, the drugs are injected into a vein (intravenously). To reduce the need for repeated needles, you may receive chemotherapy through a small medical appliance or tube inserted beneath your skin. This may be called a port-a-cath or a peripherally inserted central catheter (PICC), or it may have another name.

You will usually have chemotherapy as an outpatient (also called a day patient), but some people need to stay in hospital overnight.

▶ See our *Understanding Chemotherapy* booklet.

Each chemotherapy treatment is called a cycle and is followed by a rest period to give your body time to recover. Ask your doctor about the treatment plan recommended for you and for more information on how chemotherapy works.

## Intraperitoneal chemotherapy

---

Occasionally, chemotherapy is given directly into the abdominal cavity – the space between the organs in the abdomen and the walls of the abdomen. This is known as intraperitoneal chemotherapy.

It may be offered for stage 3 cancer with less than 1 cm of tumour remaining after surgery. Some studies have shown it may be more effective than giving chemotherapy through an intravenous drip.

In this method, the drugs are delivered through a tube (catheter) that is put in place during surgery and removed once the course of chemotherapy is over.

Ask your medical oncologist for more information about this type of chemotherapy and the benefits and risks. Some studies are looking at giving heated intraperitoneal chemotherapy (HIPEC) immediately after surgery. This is thought to make the chemotherapy work better.

Intraperitoneal chemotherapy is used only in specialised units in Australia.

---

## Blood tests during chemotherapy

You will have blood tests before each chemotherapy cycle, to check your body's healthy cells have had time to recover. If your blood count has not recovered, which can be common, there maybe a delay before your next treatment.

In some cases, you may also have blood tests during treatment to check for the CA125 tumour marker (see page 17):

- If your CA125 level was high before chemotherapy, it will be expected to fall as chemotherapy destroys the cancer cells.
- If the CA125 level stays the same or rises during chemotherapy, it may mean the cancer is not responding to treatment.
- If you did not have raised CA125 when you were diagnosed, this blood test won't be used to monitor if the treatment is working.

## Emma's story

*Although I had a long history of gynaecological problems, my diagnosis of ovarian cancer at age 36 was a complete surprise.*

*During an emergency operation to fix a twisted ovary, the doctors took a biopsy from an ovarian cyst. Five days later, I got a call to say I had ovarian cancer.*

*I had surgery to remove my remaining ovary, along with the uterus and some lymph nodes. Luckily the cancer was found early and it hadn't spread outside the ovary.*

*As they found a clustering of cells in my abdomen during the surgery, the medical oncologist recommended I have a course of chemotherapy to help prevent the cancer coming back.*

*Even though I was young and fit, I found the chemotherapy very difficult. I had treatment weekly for 16 weeks and had a lot of side effects, including fatigue, nausea,*

*diarrhoea and constipation, numbness in the hands and feet, and hair loss.*

*I also had a bad reaction to the first drug, which meant I had to take medicines before each infusion to try to prevent this.*

*Although some people bounce right back, once treatment was over I questioned my values and reasons for being here. Attending support groups and seeing an oncology psychologist really helped me come to grips with the experience of having had ovarian cancer, and my emotions are now in a much better place.*

*My body also needed time to recover after treatment. Although I'm still dealing with lymphoedema and fatigue, I'm happy to be getting back to work and my usual activities.*

*I now realise how important it is to build a relationship with my health care professionals and to actively look after my health.*

## Side effects of chemotherapy

Chemotherapy can affect healthy cells in the body, which may cause side effects. Not everyone will have side effects, and they will vary according to the drugs you are given. Your treatment team will talk to you about what to expect and how to manage any side effects (see also *Managing side effects* on pages 47–56).

**Fatigue** – Fatigue is very common during and after treatment for cancer, but can also be caused by other factors. Your red blood cell level may drop (anaemia), which can cause you to feel tired and short of breath.

▶ See our *Fatigue and Cancer* fact sheet.

**Nausea and vomiting** – Some types of chemotherapy drugs may make you feel sick (nauseous) or vomit. You will probably be given anti-nausea medicines with each chemotherapy session to help prevent or reduce nausea and vomiting. Whether or not you feel sick is not a sign of how well the treatment is working.

**Changed bowel habits** – Some chemotherapy drugs, pain medicines and anti-nausea drugs can cause constipation or diarrhoea. Tell your doctor or nurse if your bowel habits have changed.

**Joint and muscle pain** – This may occur after your treatment session. It may feel like you have the flu, but the symptoms should disappear within a few days. Ask your doctor if taking a mild pain medicine such as paracetamol may help.

**Risk of infections** – Chemotherapy reduces your white blood cell level, making it harder for your body to fight infections. Colds, flu and viruses may be easier to catch and harder to shake off, and scratches or

cuts may get infected more easily. You may also be more likely to catch a serious infection and need to be admitted to hospital. Contact your doctor or go to the nearest hospital immediately if you have one or more symptoms of an infection, such as:

- a temperature of 38°C or above
- chills or shivering
- burning or stinging feeling when urinating
- a severe cough or sore throat
- severe abdominal pain, constipation or diarrhoea
- any sudden decline in your health.

**Hair loss** – Depending on the chemotherapy drug you receive, you will probably lose your head and body hair. Some treatment centres offer cold caps, which can sometimes reduce the amount of hair loss.

The hair will grow back after treatment ends, but the colour and texture may be different for a while. If you choose to wear a wig until your hair grows back, call Cancer Council 13 11 20 to find out about wig services in your area. If you have private health insurance, check whether they'll cover the cost of a wig because of hair loss related to chemotherapy.

▶ See our *Hair Loss* fact sheet.

**Numbness or tingling in your hands and feet** – This is known as peripheral neuropathy, and it can be a side effect of certain chemotherapy drugs. Let your doctor know if this happens, as your dose of chemotherapy may need to be adjusted.

▶ See our *Understanding Peripheral Neuropathy and Cancer* fact sheet.

*“I kept a notebook to record my chemotherapy symptoms and any questions I had.”* ANN

## Targeted therapy

Targeted therapy drugs can target specific features of cancer cells to stop the cancer growing and spreading. These drugs are used to treat ovarian cancer that has come back or advanced ovarian cancer.

Whether you are offered targeted therapy drugs will depend on:

- the type of ovarian cancer you have
- other treatments you've already had and if they've worked
- whether you have a particular gene change (fault) that may respond to targeted therapy drugs.

### Types of targeted therapy drugs

**Olaparib** – This targeted therapy drug blocks poly (ADP-ribose) polymerase (PARP), a protein that targets cancer cells that have a BRCA1 or BRCA2 gene fault.

You may be offered olaparib after chemotherapy to treat a high-grade epithelial ovarian cancer. This is known as maintenance treatment. Or you may have olaparib if the cancer has come back (recurred) after initial chemotherapy. Olaparib is taken as a tablet twice a day for as long as the drug appears to be helping control the cancer.

**Bevacizumab** – This targeted therapy drug is sometimes used to treat advanced epithelial tumours. It is given with chemotherapy every three weeks as a drip into a vein (intravenous infusion). Treatment will continue for 12 months for women first diagnosed with ovarian cancer, or for as long as it's working if it is used for cancer that has come back.

Other targeted therapy drugs may be available on clinical trials (see page 27). Talk with your doctor about what new drugs are available and whether you are a suitable candidate.

## Side effects of targeted therapy

Although targeted therapy drugs limit damage to healthy cells, they can still have side effects. These vary for each person depending on the drug you are given and how your body responds. It is important to tell your doctor about any new or worsening side effects. If left untreated, some can become life-threatening. Your doctor will monitor you throughout your treatment.

The most common side effects of olaparib include nausea, fatigue, diarrhoea and low blood cell counts. More serious side effects include bone marrow or lung problems.

The most common side effects of bevacizumab include bleeding, skin rash, high blood pressure and kidney problems. In very rare cases, small tears (perforations) may develop in the bowel or stomach wall.

► See our *Understanding Targeted Therapy* fact sheet.

## Immunotherapy for ovarian cancer

---

Immunotherapy is a type of drug treatment that uses the body's own immune system to fight cancer.

International clinical trials are continuing to test immunotherapy drugs for treating ovarian cancer.

In Australia, immunotherapy drugs are currently available as treatment options for some types of cancer, such as melanoma and lung cancer.

You can ask your treatment team for the latest updates.

► See our *Understanding Immunotherapy* fact sheet.

At present, immunotherapy has not been proven to help treat ovarian cancer.

---

## Radiation therapy

Also known as radiotherapy, radiation therapy uses a controlled dose of radiation to kill cancer cells or damage them so they cannot grow, multiply or spread. The radiation is usually in the form of x-ray beams.

Radiation therapy is occasionally used to treat ovarian cancer that has spread to the pelvis or to other parts of the body. It may be used after chemotherapy or surgery to help reduce the symptoms of advanced cancer, or on its own as a palliative treatment (see opposite page).

For each radiation therapy session, you will lie on a treatment table under a large machine that delivers radiation to the affected parts of the body. You will not feel anything during the treatment, which will take only a few minutes each time. You may be in the room for a total of 10–20 minutes for each appointment.

How many radiation therapy sessions you have will depend on the type and size of the cancer and where it is located. You may have a few treatments or daily treatments for a number of weeks.

## Side effects of radiation therapy

The side effects of radiation therapy vary. Most are temporary and disappear a few weeks or months after treatment. Radiation therapy for ovarian cancer is usually given over the abdominal area, which can irritate the bowel and bladder. It can also cause infertility (see page 48).

Common side effects include feeling tired, diarrhoea, needing to pass urine more often and a burning feeling when passing urine (cystitis), and a slight reddening of the skin around the treatment site. More rarely, you may have some nausea or vomiting. If this occurs, you will be prescribed medicine to control it.

Radiation therapy can also have long-term side effects that occur months or years after therapy. This includes scarring of the bladder, vagina and bowel, as well as a very small increase in the risk of cancers in the decades after therapy.

▶ See our *Understanding Radiation Therapy* booklet.

## Palliative treatment

Palliative treatment helps to improve people's quality of life by managing the symptoms of cancer without trying to cure the disease. It is best thought of as supportive care.

Many people think that palliative treatment is only for people at the end of their life, but it can help people at any stage of advanced ovarian cancer, even if they are still having active treatment for the cancer. It is about living for as long as possible in the most satisfying way you can.

As well as slowing the spread of cancer, palliative treatment can relieve pain and help manage other symptoms. Treatment may include palliative forms of chemotherapy and radiation therapy. If you have swelling and are uncomfortable, you may have a procedure called paracentesis or an ascitic tap to drain the extra fluid from your abdomen (see page 54).

Palliative treatment is one aspect of palliative care, in which a team of health professionals aims to meet your physical, emotional, cultural, social and spiritual needs. The team also supports families and carers.

▶ See our *Understanding Palliative Care* and *Living with Advanced Cancer* booklets.

## Key points about treating ovarian cancer

---

### Treatment options

Your treatment will depend on many factors, including the type of ovarian cancer, its stage, whether you wish to have children, whether you have a gene linked to ovarian cancer, and your overall health and fitness.

---

### Surgery

- In most cases, surgery involves a total hysterectomy (removal of the uterus and cervix), as well as the removal of both fallopian tubes and both ovaries. Other nearby tissue (omentum) or lymph nodes may also be removed. All removed tissue will be checked for cancer cells.
  - It will take several weeks to recover from the operation, which will depend on the type of surgery you had.
  - You may need chemotherapy before or after surgery.
- 

### Chemotherapy

- Chemotherapy is often given soon after the surgery for 4–5 months (adjuvant therapy). In some cases of advanced ovarian cancer, it may be given before surgery (neoadjuvant therapy).
  - Side effects of chemotherapy may include tiredness, nausea and vomiting, and hair loss.
- 

### Other treatments

- Sometimes targeted therapy drugs are used to help stop the cancer growing. You may need a genetic test to see if you are likely to respond to these drugs.
  - Radiation therapy is offered in some cases. This uses radiation to damage cancer cells.
  - Palliative treatment aims to improve your quality of life by relieving the symptoms of cancer.
-

# Managing side effects

Treatment can cause physical and emotional changes. Some people experience many side effects, while others have few. Most side effects are temporary, but some may be permanent. It is important to tell your treatment team about any new or ongoing side effects you have, as they will often be able to help you manage them. This chapter also offers tips for coping with some common side effects.

## Fatigue

It is common to feel very tired and lack energy during or after treatment. Fatigue for people with cancer is different from tiredness as it doesn't always go away with rest or sleep. Most people who have chemotherapy will start treatment before they have had time to fully recover from their operation. Fatigue may continue for a while after chemotherapy has finished, but it is likely to gradually improve over time. In some cases, it may take a year or two to feel well again.

► See our fact sheet and listen to our podcast episode on fatigue.

### Tips for managing fatigue

- Plan your day. Set small, manageable goals and rest before you get too tired.
- Ask for and accept offers of help with tasks such as cleaning and shopping.
- Eat healthy, well-balanced meals to keep your energy levels up.
- Do some regular light exercise. This has been shown to boost energy levels and make you feel less tired.
- Talk to your doctor about what type of exercise would be suitable for you or ask for a referral to a physiotherapist or exercise physiologist.

## Infertility

Surgery or radiation therapy for ovarian cancer may mean you are unable to conceive a child. This is known as infertility. Before treatment starts, ask your doctor or a fertility specialist about what options are available to you. If you have stage 1 ovarian cancer and have not yet reached menopause, it may be possible to leave the uterus and one ovary in place (unilateral salpingo-oophorectomy, see page 31).

Being told that your reproductive organs will be removed or will no longer work and that you won't be able to have children can be devastating. Even if your family is complete or you did not want children, you may still feel a sense of loss and grief.

Speaking to a counsellor or gynaecological oncology nurse about your feelings can be helpful.

▶ See our *Fertility and Cancer* booklet.

## Menopause

If you were still having periods (menstruating) before surgery, having your ovaries removed will mean you no longer produce the hormones oestrogen and progesterone, and your periods will stop. This is called menopause. When menopause occurs naturally, it is a gradual process that usually starts between the ages of 45 and 55, but menopause after surgery is sudden.

Symptoms of menopause can include hot flushes, dry or itchy skin, mood swings, trouble sleeping (insomnia), tiredness and vaginal dryness. These symptoms are usually more intense after surgery than during a natural menopause, because the body hasn't had time to get used to the gradual decrease in hormone levels.

## Managing the symptoms of menopause

### Check your cholesterol levels

Cholesterol levels can change after menopause, which can lead to heart disease. You can manage cholesterol levels with regular exercise and a balanced diet. Ask your doctor about cholesterol-lowering drugs.

### Use a vaginal moisturiser

This will help with vaginal discomfort and dryness. You can buy a vaginal moisturiser over the counter from chemists.

### Learn meditation and relaxation techniques

These may help reduce stress and lessen symptoms.

### Ask about menopause hormone therapy (MHT)

Previously called hormone replacement therapy (HRT), there are benefits and risks to managing menopause with MHT. Ask your doctor if MHT is safe for you to use after treatment for ovarian cancer.

### Have your bone density checked

Menopause can increase your risk of developing thinning of the bones (osteoporosis). Talk to your doctor about having a bone density test or taking medicines to prevent your bones becoming weak. Regular exercise will help keep your bones strong. For more information, call Healthy Bones Australia on 1800 242 141 or visit [healthybonesaustralia.org.au](http://healthybonesaustralia.org.au).

## Impact on sexuality and intimacy

Ovarian cancer can affect your sexuality in physical and emotional ways. The impact of these changes depends on many factors, such as treatment and side effects, your self-confidence, and whether you have a partner.

It is important to feel that your sexuality is respected when discussing how cancer treatment will affect you. Whatever your gender identity or sexual orientation, your medical team should be able to openly discuss your needs and support you through treatment. Try to find a doctor who helps you feel at ease talking about sexual issues and relationships.

**Physical changes** – Treatment can cause dryness and scarring of the vagina, and internal scar tissue (pelvic adhesions, see page 52). These side effects can make sexual penetration painful, and you may have to find different ways to climax (orgasm). The experience of having cancer may mean you lose interest in intimacy and sex (low libido).

**Emotional changes** – For most people, sex is more than arousal, intercourse and orgasms. It involves feelings of intimacy and acceptance, as well as being able to give and receive love. Although sexual intercourse may not always be possible, closeness and sharing can still be part of your relationship.

Changes to your body can affect the way you feel about yourself (your self-esteem) and make you feel self-conscious. You may feel less confident about who you are and what you can do. Give yourself time to get used to any changes. Try to see yourself as a whole person (body, mind and personality) instead of focusing on the parts that have changed.

- ▶ See our *Sexuality, Intimacy and Cancer* booklet and listen to our “Sex and Cancer” podcast episode.

## Tips for managing sexual changes

- Enjoy other physical touch with your partner without having sexual intercourse to maintain intimacy. Try touching, hugging, massaging, holding hands and having a bath together.
- Let your partner know if you don't feel like having sex, or if you find penetration uncomfortable.
- Talk to your doctor about ways to manage side effects that change your sex life. These may include using vaginal dilators, lubricants and moisturisers.
- If you find that vaginal dryness is a problem, take more time before and during sex to help the vagina relax and become well aroused.
- Use lubricant to make sexual intercourse more comfortable. Choose a water-based or silicone-based gel with no added perfumes or colouring (e.g. Pjur or Astroglide).
- Spend more time on foreplay and try different ways to become aroused.
- Try different positions during sex to work out which position is the most comfortable for you.
- If you can't enjoy penetrative sex, explore other ways to climax, such as oral and manual stimulation.
- Talk about how you're feeling with your sexual partner or doctor, or ask your treatment team for a referral to a sexual therapist or psychologist.
- Do some regular physical activity to boost your energy and mood.
- Talk to your GP about managing any depression as it may be affecting your libido and desire for intimacy.
- For ideas on how to talk to your treatment team about sexual changes, visit [Cancer Australia at \*canceraustralia.gov.au\*](http://canceraustralia.gov.au) and search for their online resource *Intimacy and sexuality for women with gynaecological cancer – starting a conversation*.

## Bowel changes

After surgery or during chemotherapy or radiation therapy, some people notice changes with how their bowel works. You may have diarrhoea, constipation or stomach cramps. Pain medicines may also make you feel constipated. Diarrhoea and constipation can occur for some time, but are usually temporary.

Sometimes tissues in the pelvis stick together after surgery. This is called a pelvic adhesion, and it can be painful and cause ongoing bowel problems such as constipation. In rare cases, it may need further surgery.

To help manage bowel changes, ask your doctor, nurse or dietitian for advice about eating and drinking, and see the tips below.

► See our *Nutrition for People Living with Cancer* booklet.

### Tips for managing bowel changes

- Drink plenty of liquids to replace fluids lost through diarrhoea or to help soften faeces (poo) if you are constipated. Avoid alcohol, caffeinated drinks and very hot or very cold liquids.
- Avoid fried, spicy or greasy foods, which can cause pain and make diarrhoea and constipation worse.
- Ask your pharmacist or doctor about suitable medicines to relieve symptoms of diarrhoea or constipation.
- Eat small, frequent meals instead of three big ones.
- Drink peppermint or chamomile tea to reduce stomach or wind pain.
- If you have diarrhoea, rest as much as possible – diarrhoea can make you feel very tired.
- If you are constipated, consider taking laxatives and do some gentle exercise, such as walking.

## Treating a blockage in the bowel

When food can't pass through the bowel it can become blocked. This is known as a bowel obstruction. Causes may include surgery or radiation therapy or the cancer coming back. Symptoms may include feeling sick, vomiting, or a swollen and painful stomach. Bowel obstruction can be serious. How it is treated will depend on its cause, where it is in the bowel, and your general health. Options may include:

**Resting the bowel** – A bowel obstruction can sometimes be treated by resting the bowel, which means not eating or drinking and having fluid through an intravenous drip until the blockage clears.

**Taking medicines** – Your doctor may prescribe an anti-inflammatory medicine to reduce the swelling around the obstruction.

**Inserting a stent** – Surgery may help clear some bowel obstructions. If only one area is blocked, you may have a small tube (stent) put in to help keep the bowel open and relieve symptoms. The stent is inserted through the rectum using a flexible tube called an endoscope.

**Creating a stoma** – If the bowel is blocked in more than one spot, you may have a stoma. This surgically created opening in the abdomen removes bowel movements from the body. A stoma may be a colostomy (made from the colon in the large bowel) or an ileostomy (made from the ileum in the small bowel). A small bag called a stoma bag or appliance is worn on the outside of the body to collect the waste. The stoma may be reversed when the blockage is cleared, or it may be permanent.

For more information on caring for a stoma, visit the Australian Association of Stomal Therapy Nurses at [stomalthrapy.com](http://stomalthrapy.com) or the Australian Council of Stoma Associations at [australianstoma.com.au](http://australianstoma.com.au).

## Fluid build-up

Sometimes ovarian cancer can cause fluid to build up in different parts of the body.

**Ascites** – This is when fluid collects in the abdomen. It causes swelling and pressure, which can be uncomfortable and make you feel breathless.

If you have ascites, your doctor may inject a local anaesthetic into the abdomen and then insert a needle to take a sample of the fluid. This is called a paracentesis or ascitic tap. The fluid sample is sent to a laboratory to be examined under a microscope for cancer cells.

Sometimes, to make you feel more comfortable, the doctor will remove all the remaining fluid from your abdomen. It will take a few hours for the fluid to drain into a drainage bag and then the tube will be removed from your abdomen.

**Pleural effusion** – If the cancer has spread to the lungs, fluid builds up in the area between the lung and the chest wall (pleural space). It can cause pain and breathlessness. The fluid can be drained using a procedure called a thoracentesis or pleural tap. Your doctor will inject a local anaesthetic into the chest area, and then insert a needle into the pleural space to drain the fluid.

## Lymphoedema

If you have lymph nodes removed from the pelvis as part of surgery (a lymphadenectomy, see page 30), you may find that one or both legs become swollen. This is known as lymphoedema. It can happen if lymph fluid doesn't circulate properly and builds up in the legs. Radiation therapy in the pelvic area may also cause lymphoedema.

Lymphoedema can make movement and some types of activities difficult. The swelling may appear at the time of treatment or months or years later. It is important to seek help with lymphoedema symptoms as soon as possible because early diagnosis and treatment lead to better outcomes.

## Tips for managing lymphoedema

- Manage and reduce the swelling of lymphoedema with gentle exercise, compression stockings and a type of massage called manual lymphatic drainage.
- Keep your skin clean and apply moisturiser every day.
- Protect your skin from cuts, scratches, bites and burns to reduce the risk of infection.
- See a trained lymphoedema practitioner for a treatment plan and ongoing care. Visit the Australasian Lymphology Association website at [lymphoedema.org.au](http://lymphoedema.org.au).
- Check if your state or territory has a compression garment scheme. These schemes cover some, or all, of the cost of a compression garment. For more information, visit [lymphoedema.org.au](http://lymphoedema.org.au).
- Talk to your GP about how a Chronic Disease Management Plan can help you manage the condition.
- ▶ See our *Understanding Lymphoedema* fact sheet.

## Key points about managing side effects

---

### What to expect after treatment

- Cancer treatment can cause a range of side effects, but there are often ways to reduce or manage them.
- The most common side effect is fatigue. This may continue for a while after treatment has finished. It may help to plan your activities so you can take regular rest breaks.

---

### Infertility, menopause and sexuality

- If you are unable to have children (infertility) as a result of treatment for ovarian cancer, you may feel very upset. Talking with your family, friends or a counsellor may be helpful.
- If your ovaries have been removed, you will go through menopause. This means that your periods will stop and it will no longer be possible to become pregnant. You may also have other symptoms of menopause.
- Treatment for ovarian cancer can have an impact on sexuality and self-esteem. There are things you can do to manage these changes.

---

### Other side effects

- Bowel changes such as diarrhoea, cramps or constipation are common. Less often, the bowel might become blocked.
- If fluid builds up in your abdomen (ascites) or in your chest cavity (pleural effusion), your medical team may need to drain it.
- If fluid builds up in the legs (lymphoedema), a lymphoedema practitioner can help you manage it with gentle exercise, compression stockings and massage.

# Looking after yourself

Cancer can cause physical and emotional strain, so it's important to look after your wellbeing. Cancer Council has free booklets and programs to help you during and after treatment. Call 13 11 20 to find out more, or visit your local Cancer Council website (see back cover).

**Eating well** – Healthy food can help you cope with treatment and side effects. A dietitian can explain how to manage any special dietary needs or eating problems and choose the best foods for your situation.

▶ See our *Nutrition for People Living with Cancer* booklet.

**Staying active** – Physical activity can reduce tiredness, improve circulation and lift mood. The right exercise for you depends on what you are used to, how you feel, and your doctor's advice.

▶ See our *Exercise for People Living with Cancer* booklet.

**Complementary therapies** – Complementary therapies are designed to be used alongside conventional medical treatments. Therapies such as massage, relaxation and acupuncture can increase your sense of control, decrease stress and anxiety, and improve your mood. Let your doctor know about any therapies you are using or thinking about trying, as some may not be safe or evidence-based.

▶ See our *Understanding Complementary Therapies* booklet.

Alternative therapies are therapies used instead of conventional medical treatments. These are unlikely to be scientifically tested, may prevent successful treatment of the cancer and can be harmful. Cancer Council does not recommend the use of alternative therapies as a cancer treatment.

**Work and money** – Cancer can change your financial situation, especially if you have extra medical expenses or need to stop working. Getting professional financial advice and talking to your employer can give you peace of mind. You can also check whether any financial assistance is available to you by asking a social worker at your hospital or treatment centre or calling Cancer Council 13 11 20.

▶ See our *Cancer and Your Finances* and *Cancer, Work & You* booklets.

**Relationships** – Having cancer can affect your relationships with family, friends and colleagues in different ways. Cancer is stressful, tiring and upsetting, and this may strain relationships. The experience may also result in positive changes to your values, priorities or outlook on life. Give yourself time to adjust to what's happening, and do the same for those around you. It may help to discuss your feelings with each other.

▶ See our *Emotions and Cancer* booklet.

**Sexuality** – Cancer can affect your sexuality in physical and emotional ways. The impact of these changes depends on many factors, such as treatment and side effects, your self-confidence, and if you have a partner. Although sexual intercourse may not always be possible, closeness and sharing can still be part of your relationship.

▶ See pages 50–51 and our *Sexuality, Intimacy and Cancer* booklet.

**Contraception and fertility** – If you can have sex, you may need to use certain types of contraception to protect your partner or avoid pregnancy for a time. Your doctor will explain what precautions to take. They will also tell you if treatment will affect your fertility permanently or temporarily. If having children is important to you, discuss the options with your doctor before starting treatment.

▶ See page 48 and our *Fertility and Cancer* booklet.

# Life after treatment

For most people, the cancer experience doesn't end on the last day of treatment. Life after cancer treatment can present its own challenges. You may have mixed feelings when treatment ends, and worry that every ache and pain means the cancer is coming back.

Some people say that they feel pressure to return to "normal life". It is important to allow yourself time to adjust to the physical and emotional changes, and establish a new daily routine at your own pace. Your family and friends may also need time to adjust.

Cancer Council 13 11 20 can help you connect with others who have had ovarian cancer, and provide you with information about the emotional and practical aspects of living well after cancer.

► See our *Living Well After Cancer* booklet.

## Dealing with feelings of sadness

---

If you have continued feelings of sadness, have trouble getting up in the morning or have lost motivation to do things that previously gave you pleasure, you may be experiencing depression. This is quite common among people who have had cancer.

Talk to your GP, because counselling or medication – even for a short time – may help. Some people can

get a Medicare rebate for sessions with a psychologist. Ask your doctor if you are eligible. Cancer Council may also run a counselling program in your area.

For information about depression, call Beyond Blue on 1300 22 4636 or visit [beyondblue.org.au](http://beyondblue.org.au). For 24-hour crisis support, call Lifeline 13 11 14 or visit [lifeline.org.au](http://lifeline.org.au).

## Follow-up appointments

After treatment ends, you will have regular appointments to monitor your health, manage any long-term side effects and look for any signs that the cancer has come back or spread. These are known as follow-up appointments.

In most cases, follow-up appointments will be with your gynaecological oncologist and medical oncologist. They may perform a physical examination, which may include an internal examination, and arrange blood tests or scans such as ultrasounds and CT scans. You will also be able to discuss any concerns you may have.

There is no set follow-up schedule for ovarian cancer, but it's common to see a specialist every three months for the first few years, and then every four to six months for up to five years. Some people prefer not to follow a schedule but to see their specialist if they experience symptoms. Check with your doctor if you are unsure of your follow-up plan.

Your check-ups will become less frequent if you have no further problems. Between follow-up appointments, let your doctor know immediately of any symptoms or health problems.

## What if ovarian cancer returns?

If ovarian cancer is advanced at diagnosis, it often does come back after treatment and a period of improvement (remission). This is known as a recurrence and it is why regular follow-up appointments are important. In some cases, there may be a number of recurrences, with long gaps in between recurrences when cancer treatment is not needed. Early-stage ovarian cancer is less likely to come back than advanced ovarian cancer.

## Having CA125 blood tests

---

Your specialist will also talk to you about the advantages and disadvantages of having regular blood tests for the tumour marker CA125. This test is optional.

There is some research to suggest that waiting until new symptoms develop before starting treatment is just as effective as starting

treatment earlier because of a rise in CA125. Not having treatment until you have new symptoms may mean that your quality of life is better for longer because side effects of further treatment are delayed.

For germ cell tumours or stromal tumours, you may have tests for tumour markers other than CA125.

---

The most common treatment for epithelial ovarian cancer that has come back is more chemotherapy or targeted therapy. The drugs used will depend on what drugs you had initially, the length of remission, the aim of the treatment as well as your general health and any side effects from previous treatments. The drugs used the first time may be given again if you had a good response to them and the cancer stayed away for six months or more.

New drugs are constantly being developed and there have been a number of important developments in recent years. Genetic tests and targeted therapy are offering new treatment options for people with ovarian cancer. Talk with your doctor about the latest developments and whether a clinical trial (see page 27) may be right for you.

When a follow-up appointment or test is approaching, you may find that you think more about the cancer and feel anxious. Talk to your treatment team or call Cancer Council 13 11 20 if you are finding it hard to manage this anxiety.

## Living with ovarian cancer

One of the challenges of a cancer diagnosis is dealing with uncertainty. When first diagnosed, many people want to know what's going to happen and when it will be over. But living with uncertainty is part of having cancer, especially if the cancer is advanced.

There are some questions that there will be no answers for. Learning as much as you can about the cancer and its treatment may make you feel more in control.

### Tips for living with ovarian cancer

- Talk with other people who have had ovarian cancer. You may find it reassuring to hear about their experiences. See pages 64–65 for details about support groups.
- Keep a diary to track how you're feeling.
- Explore different ways to relax, such as meditation or yoga.
- Talk to a psychologist or counsellor about how you are feeling – they may be able to teach you some strategies to help you manage your fears.
- Practise letting your thoughts come and go without getting caught up in them.
- Try to exercise regularly. Research shows that exercise can help people cope with the side effects of treatment.
- Focus on making healthy choices in areas of your life that you can control, such as eating well and getting regular exercise.
- Set yourself some goals – as you achieve each one, set some new goals.
- Listen to our “Managing Fear” and “Living Well with Advanced Cancer” podcast episodes.

# Caring for someone with cancer

You may be reading this booklet because you are caring for someone with ovarian cancer. What this means for you will vary depending on the situation. Being a carer can bring a sense of satisfaction, but it can also be challenging and stressful.

It is important to look after your own physical and emotional wellbeing. Give yourself some time out and share your concerns with somebody neutral such as a counsellor or your doctor, or try calling Cancer Council 13 11 20. There is a wide range of support available to help you with the practical and emotional aspects of your caring role.

**Support services** – Support services such as Meals on Wheels, home help or visiting nurses can help you in your caring role. You can find local services, as well as information and resources, through the Carer Gateway. Call 1800 422 737 or visit [carergateway.gov.au](http://carergateway.gov.au).

**Support groups and programs** – Many cancer support groups and cancer education programs are open to carers as well as to people with cancer. Support groups and programs offer the chance to share experiences and ways of coping.

**Carers Australia** – Carers Australia provides information and advocacy for carers. Visit [carersaustralia.com.au](http://carersaustralia.com.au).

**Cancer Council** – You can call Cancer Council 13 11 20 or visit your local Cancer Council website to find out more about carers' services.

▶ See our *Caring for Someone with Cancer* booklet.

# Seeking support

A cancer diagnosis can affect every aspect of your life. You will probably experience a range of emotions – fear, sadness, anxiety, anger and frustration are all common reactions. Cancer also often creates practical and financial issues.

There are many sources of support and information to help you, your family and carers navigate all stages of the cancer experience, including:

- information about cancer and its treatment
- access to benefits and programs to ease the financial impact of cancer treatment
- home care services, such as Meals on Wheels, visiting nurses and home help
- aids and appliances
- support groups and programs
- counselling services.

The availability of services may vary depending on where you live, and some services will be free but others might have a cost.

To find good sources of support and information, you can talk to the social worker or nurse at your hospital or treatment centre, or get in touch with Cancer Council 13 11 20.

Ovarian Cancer Australia provides an online forum, support groups and a free resilience kit on their website – visit [ovariancancer.net.au](http://ovariancancer.net.au). The Ovarian Cancer Research Alliance (OCRA) has an online support group for women from all over the world at [inspire.com/groups/ovarian-cancer](http://inspire.com/groups/ovarian-cancer).

## Support from Cancer Council

Cancer Council offers a range of services to support people affected by cancer, their families and friends. Services may vary by location.

### Cancer Council 13 11 20

Our experienced health professionals will answer any questions you have about your situation and link you to local services (see inside back cover).

### Information resources

Cancer Council produces booklets and fact sheets on more than 25 types of cancer, as well as treatments, emotional and practical issues, and recovery. Call 13 11 20 or visit your local Cancer Council website.

### Legal and financial support

If you need advice on legal or financial issues, we can refer you to qualified professionals. These services are free for people who can't afford to pay. Financial assistance may also be available. Call Cancer Council 13 11 20 to ask if you are eligible.

### Practical help

Cancer Council can help you find services or offer guidance to manage the practical impacts of cancer. This may include helping you access accommodation and transport services.

### Peer support services

You might find it helpful to share your thoughts and experiences with other people affected by cancer. Cancer Council can link you with individuals or support groups by phone, in person, or online. Call 13 11 20 or visit [cancerCouncil.com.au/OC](http://cancerCouncil.com.au/OC).

## Useful websites

You can find many useful resources online, but not all websites are reliable. These websites are good sources of support and information.

# Question checklist

---

Asking your doctor questions will help you make an informed choice. You may want to include some of the questions below in your own list.

---

## Diagnosis

- What type of ovarian cancer do I have?
  - Has the cancer spread? If so, where has it spread? How fast is it growing?
  - Are the latest tests and treatments for this cancer available in this hospital?
  - What sort of genetic testing can I have? Can I see a genetic counsellor?
  - Will a multidisciplinary team be involved in my care?
  - Are there clinical guidelines for this type of cancer?
- 

## Treatment

- What treatment do you recommend? What is the aim of the treatment?
  - Are there other treatment choices for me? If not, why not?
  - If I don't have the treatment, what should I expect?
  - How long do I have to make a decision?
  - I'm thinking of getting a second opinion. Can you recommend anyone?
  - How long will treatment take? Will I have to stay in hospital?
  - Are there any out-of-pocket expenses not covered by Medicare or my private health cover? Can the cost be reduced if I can't afford it?
  - How will we know if the treatment is working?
  - Are there any clinical trials or research studies I could join?
- 

## Side effects

- What are the risks and possible side effects of each treatment?
  - Will I have a lot of pain? What will be done about this?
  - Can I work, drive and do my normal activities while having treatment?
  - Will the treatment affect my sex life and fertility? What are my fertility options?
  - Should I change my diet or physical activity during or after treatment?
  - Are there any complementary therapies that might help me?
- 

## After treatment

- How often will I need check-ups after treatment? Who should I see?
  - If the cancer returns, how will I know? What treatments could I have?
-

# Glossary

---

## **abdomen**

The part of the body between the chest and hips, which contains the stomach, spleen, pancreas, liver, gall bladder, bowel, bladder and kidneys. The lower abdomen (pelvic cavity) contains the ovaries and other female reproductive organs. Also known as the belly.

## **advanced cancer**

Cancer that is unlikely to be cured. In most cases, the cancer has spread to other parts of the body (secondary or metastatic cancer). Treatment can often still control the cancer and manage symptoms.

## **ascites**

Collection of fluid in the abdomen.

---

## **bilateral salpingo-oophorectomy**

Surgery to remove both ovaries and both fallopian tubes.

## **biopsy**

The removal of a sample of tissue from the body for examination under a microscope to help diagnose a disease.

## **bladder**

The hollow muscular organ that stores urine. It is located in the pelvis.

## **borderline tumour**

A type of ovarian tumour that is not considered cancerous. Also called low malignant potential tumour.

## **bowel**

The long, tube-shaped organ in the abdomen that is part of the digestive tract. The bowel has two main parts: the small bowel and the large bowel.

## **bowel obstruction**

When the bowel is blocked and waste matter cannot pass through easily.

## **BRCA1 or BRCA2 mutation**

A gene change that increases the risk of getting breast or ovarian cancer.

---

## **CA125**

A protein found in the blood. It is often higher than normal in people with ovarian cancer.

## **cervix**

The lower part of the uterus that connects the uterus to the vagina. Also known as the neck of the uterus.

## **chemotherapy**

A cancer treatment that uses drugs to kill cancer cells or slow their growth. May be given alone or with other treatments.

## **colectomy**

An operation in which cancerous areas of the colon are cut out and the healthy parts are sewn back together.

## **colostomy**

A surgically created opening (stoma) in the abdomen to the outside of the body. It is made from the colon (part of the large bowel).

## **CT scan**

Computerised tomography scan. This scan uses x-rays to create cross-sectional pictures of the body.

---

## **debulking**

Surgery to remove as much of a tumour as possible.

---

## **endoscope**

A flexible tube with a light and camera on the end. It is used during diagnostic tests to look inside the body.

## **epithelial ovarian cancer**

Ovarian cancer that starts in the surface of the ovary (epithelium).

---

## epithelium

Layers of cells covering internal and external surfaces of the body.

---

## fallopian tubes

Two thin tubes that form part of the female reproductive system. The tubes carry sperm from the uterus to the ovaries, and a fertilised egg from the ovaries to the uterus.

## family cancer centre

A medical clinic that offers genetic counselling and other services for people with a family history of cancer. Also called a familial cancer centre.

## female reproductive system

The tissues, glands, and organs involved in producing children. This includes the ovaries, fallopian tubes, cervix, vagina and vulva (external genitals).

---

## genes

The microscopic units that determine how the body's cells grow and behave. Genes are found in every cell of the body and are inherited from both parents.

## genetic testing

Genetic testing aims to detect gene changes that are more commonly seen in certain types of cancer.

## germ cell ovarian cancer

Ovarian cancer that begins in the cells that eventually develop into eggs.

## germ cells

Cells that become eggs in females and sperm in males. Also called germinal cells.

## grade

A number that describes how similar cancer cells look to normal cells and how quickly the cancer is likely to grow.

## gynaecological oncologist

A gynaecologist who specialises in treating cancer of the female reproductive organs.

---

## hysterectomy

Surgery to remove the uterus. See also total hysterectomy.

---

## ileostomy

A surgically created opening (stoma) in the abdomen to the outside of the body. It is made from the ileum (part of the small bowel).

## immunotherapy

Treatment that uses the body's own immune system to fight cancer.

## infertility

The inability to conceive a child.

## intraoperative chemotherapy

A technique of putting chemotherapy into the abdominal cavity.

---

## laparoscopy

Surgery done through small cuts in the abdomen using a viewing instrument called a laparoscope.

## laparotomy

A type of open surgery in which a long cut is made in the abdomen to examine and remove internal organs.

## lymphadenectomy

Surgical removal of the lymph nodes from a part of the body. Also called a lymph node dissection.

## lymph nodes

Small, bean-shaped structures found in groups throughout the body. They help protect the body against disease and infection. Also called lymph glands.

## lymphoedema

Swelling caused by a build-up of lymph fluid.

## Lynch syndrome

A genetic condition that increases the risk of developing ovarian cancer.

---

### **maintenance treatment**

Treatment given for months or years as part of the treatment plan after the initial treatment to prevent the cancer coming back.

### **malignant**

Cancerous. Malignant cells can spread (metastasise) and eventually cause death if they cannot be treated.

### **menopause**

When periods (menstruation) stop. This can happen naturally; because of cancer treatment; or because the ovaries have been removed.

### **menopause hormone therapy (MHT)**

Drug therapy that supplies the body with hormones that it is no longer able to produce naturally. Previously known as hormone replacement therapy (HRT).

### **metastasis (plural: metastases)**

Cancer that has spread from a primary cancer in another part of the body. Also called secondary or advanced cancer.

---

### **oestrogen**

One of the two major sex hormones in females. It is produced mainly by the ovaries and helps regulate the female reproductive cycle.

### **omentectomy**

Surgical removal of the omentum.

### **omentum**

A protective apron of fatty tissue over the abdominal organs.

### **ovary**

A female reproductive organ that contains eggs (ova). It produces the hormones oestrogen and progesterone.

### **ovulation**

The release of an egg (ovum) during menstruation or period.

---

### **palliative treatment**

Medical treatment for people with advanced cancer to help them manage pain and other symptoms.

### **paracentesis**

The draining of excess fluid from the abdomen. Also called an ascitic tap.

### **patient-controlled analgesia (PCA)**

An intravenous system that allows a person to administer a measured dose of pain relief by pressing a button.

### **pelvis**

The lower part of the trunk of the body; roughly, the area that extends from hip to hip and waist to groin.

### **peritoneum**

The lining of the abdomen.

### **pleural effusion**

A collection of fluid in the chest cavity between the two sheets of tissue that cover the lungs.

### **progesterone**

One of the two major sex hormones in females. It is made mostly by the ovaries and prepares the lining of the uterus (endometrium) for pregnancy.

### **puberty**

The process of reaching sexual maturity and becoming capable of reproduction.

---

### **radiation therapy (radiotherapy)**

The use of targeted radiation to kill or damage cancer cells so they cannot grow, multiply or spread. This is usually in the form of x-ray beams.

### **rectum**

The last 15–20 cm of the large bowel, just above the anus.

### **recurrence**

The return of a disease after a period of improvement (remission).

---

## remission

When the symptoms and signs of the cancer reduce or disappear.

---

## stage

The extent of a cancer and whether the disease has spread from its original site to other parts of the body.

## stromal cell cancer

Cancer that begins in the cells in the ovaries that release the hormones progesterone and oestrogen.

---

## targeted therapy

Drugs that target specific particles (molecules) within cells that allow cancer to grow and spread.

## total hysterectomy

Surgery to remove the uterus and cervix. See also hysterectomy.

## tumour marker

Chemicals produced by cancer cells and released into the blood. These may suggest the presence of a tumour. Markers can be found by blood tests or by testing tumour samples.

---

---

## ultrasound

A scan that uses soundwaves from a device called a transducer to create a picture of part of the body. The transducer may be a handheld device moved over your belly area (abdominal ultrasound) or a wand inserted in your vagina (transvaginal ultrasound).

## unilateral salpingo-oophorectomy

Surgery to remove the ovary and fallopian tube on one side of the body.

## uterus

A hollow muscular organ in a female's lower abdomen in which a baby grows during pregnancy. Also called the womb.

---

## vagina (birth canal)

A muscular canal that extends from the entrance of the uterus to the vulva.

---

# How you can help

At Cancer Council, we're dedicated to improving cancer control. As well as funding millions of dollars in cancer research every year, we advocate for the highest quality care for cancer patients and their families. We create cancer-smart communities by educating people about cancer, its prevention and early detection. We offer a range of practical and support services for people and families affected by cancer. All these programs would not be possible without community support, great and small.

**Join a Cancer Council event:** Join one of our community fundraising events such as Daffodil Day, Australia's Biggest Morning Tea, Relay For Life, Girls' Night In and other Pink events, or hold your own fundraiser or become a volunteer.

**Make a donation:** Any gift, large or small, makes a meaningful contribution to our work in supporting people with cancer and their families now and in the future.

**Buy Cancer Council sun protection products:** Every purchase helps you prevent cancer and contribute financially to our goals.

**Help us speak out for a cancer-smart community:** We are a leading advocate for cancer prevention and improved patient services. You can help us speak out on important cancer issues and help us improve cancer awareness by living and promoting a cancer-smart lifestyle.

**Join a research study:** Cancer Council funds and carries out research investigating the causes, management, outcomes and impacts of different cancers. You may be able to join a study.

To find out more about how you, your family and friends can help, please call your local Cancer Council.

# Cancer Council

## 13 11 20

Being diagnosed with cancer can be overwhelming. At Cancer Council, we understand it isn't just about the treatment or prognosis. Having cancer affects the way you live, work and think. It can also affect our most important relationships.

When disruption and change happen in our lives, talking to someone who understands can make a big difference. Cancer Council has been providing information and support to people affected by cancer for over 50 years.

Calling 13 11 20 gives you access to trustworthy information that is relevant to you. Our experienced health professionals are available to answer your questions and link you to services in your area, such as transport, accommodation and home help. We can also help with other matters, such as legal and financial advice.

If you are finding it hard to navigate through the health care system, or just need someone to listen to your immediate concerns, call 13 11 20 and find out how we can support you, your family and friends.

If you need information in a language other than English, an interpreting service is available. Call 131 450.

If you are deaf, or have a hearing or speech impairment, you can contact us through the National Relay Service. [communications.gov.au/accesshub/nrs](https://communications.gov.au/accesshub/nrs)
